

# On the usage of the **geepack**

Søren Højsgaard

February 23, 2011

## 1 Introduction

The **geepack** package for generalized estimating equations is described in Halekoh, U., Højsgaard, S., Yan, J. (2006). The package **geepack** for generalized estimating equations. Journal of Statistical Software. 15, 2. If you use **geepack** in your own work, please do cite the above reference.

This note contains a few extra examples. We illustrate the usage of a the **waves** argument and the **zcor** argument together with a fixed working correlation matrix for the **geeglm()** function. To illustrate these features we simulate some data suitable for a regression model.

```
> library(geepack)

Design library by Frank E Harrell Jr

Type library(help='Design'), ?DesignOverview, or ?Design.Overview')
to see overall documentation.

> timeorder <- rep(1:5, 6)
> tvar <- timeorder + rnorm(length(timeorder))
> idvar <- rep(1:6, each = 5)
> uu <- rep(rnorm(6), each = 5)
> yvar <- 1 + 2 * tvar + uu + rnorm(length(tvar))
> simdat <- data.frame(idvar, timeorder, tvar, yvar)
> head(simdat, 12)
```

	idvar	timeorder	tvar	yvar
1	1	1	-0.4753946	2.8614324
2	1	2	1.6930003	6.2588240
3	1	3	2.5808495	10.5887446
4	1	4	3.6886968	10.5177092
5	1	5	6.7494444	17.5831694
6	2	1	1.3520530	2.3214869
7	2	2	2.2779898	3.8724366
8	2	3	2.4005162	4.5117641
9	2	4	2.7640421	6.0197997
10	2	5	4.4855501	9.2032817
11	3	1	-0.7391984	-0.4314723
12	3	2	1.1087243	5.2813547

Notice that clusters of data appear together in **simdat** and that observations are ordered (according to **timeorder**) within clusters.

We can fit a model with an AR(1) error structure as

```

> mod1 <- geeglm(yvar ~ tvar, id = idvar, data = simdat, corstr = "ar1")
> mod1

Call:
geeglm(formula = yvar ~ tvar, data = simdat, id = idvar, corstr = "ar1")

Coefficients:
(Intercept)      tvar
    0.713142    2.198857

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 3.083684

Correlation: Structure = ar1    Link = identity
Estimated Correlation Parameters:
      alpha
0.7901617

Number of clusters:    6    Maximum cluster size: 5

```

This works because observations are ordered according to time within each subject in the dataset.

## 2 Using the waves argument

If observations were not ordered according to cluster and time within cluster we would get the wrong result:

```

> set.seed(123)
> library(doby)
> simdatPerm <- simdat[sample(nrow(simdat)), ]
> simdatPerm <- orderBy(~idvar, simdatPerm)
> head(simdatPerm)

```

	idvar	timeorder	tvar	yvar
2	1	2	1.6930003	6.258824
4	1	4	3.6886968	10.517709
1	1	1	-0.4753946	2.861432
3	1	3	2.5808495	10.588745
5	1	5	6.7494444	17.583169
9	2	4	2.7640421	6.019800

Notice that in `simdatPerm` data is ordered according to subject but the time ordering within subject is random.

Fitting the model as before gives

```

> mod2 <- geeglm(yvar ~ tvar, id = idvar, data = simdatPerm, corstr = "ar1")
> mod2

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
      corstr = "ar1")

Coefficients:
(Intercept)      tvar
    1.295851    2.039219

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 3.010603

Correlation: Structure = ar1    Link = identity
Estimated Correlation Parameters:
      alpha
0.77851

Number of clusters:    6    Maximum cluster size: 5

```

Likewise if clusters do not appear contiguously in data we also get the wrong result (the clusters are not recognized):

```
> simdatPerm2 <- orderBy(~timeorder, data = simdat)
> geeglm(yvar ~ tvar, id = idvar, data = simdatPerm2, corstr = "ar1")

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm2, id = idvar,
        corstr = "ar1")

Coefficients:
(Intercept)          tvar 
  1.228439      2.037317 

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:
Estimated Scale Parameters:  [1] 3.005313

Correlation: Structure = ar1    Link = identity
Estimated Correlation Parameters:
alpha
  0

Number of clusters:  30    Maximum cluster size: 1
```

To obtain the right result we must give the `waves` argument:

```
> wav <- simdatPerm$timeorder
> wav

[1] 2 4 1 3 5 4 5 2 1 3 2 3 4 5 1 5 4 2 1 3 3 4 5 1 2 2 5 4 1 3

> mod3 <- geeglm(yvar ~ tvar, id = idvar, data = simdatPerm, corstr = "ar1",
+               waves = wav)
> mod3

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
        waves = wav, corstr = "ar1")

Coefficients:
(Intercept)          tvar 
  0.713142      2.198857 

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:
Estimated Scale Parameters:  [1] 3.083684

Correlation: Structure = ar1    Link = identity
Estimated Correlation Parameters:
alpha
0.7901617

Number of clusters:  6    Maximum cluster size: 5
```

### 3 Using a fixed correlation matrix and the `zcor` argument

Suppose we want to use a fixed working correlation matrix:

```

> cor.fixed <- matrix(c(1, 0.5, 0.25, 0.125, 0.125, 0.5, 1, 0.25,
+   0.125, 0.125, 0.25, 0.25, 1, 0.5, 0.125, 0.125, 0.125, 0.5,
+   1, 0.125, 0.125, 0.125, 0.125, 0.125, 1), 5, 5)
> cor.fixed

      [,1] [,2] [,3] [,4] [,5]
[1,] 1.000 0.500 0.250 0.125 0.125
[2,] 0.500 1.000 0.250 0.125 0.125
[3,] 0.250 0.250 1.000 0.500 0.125
[4,] 0.125 0.125 0.500 1.000 0.125
[5,] 0.125 0.125 0.125 0.125 1.000

```

Such a working correlation matrix has to be passed to `geeglm()` as a vector in the `zcor` argument. This vector can be created using the `fixed2Zcor()` function:

```

> zcor <- fixed2Zcor(cor.fixed, id = simdatPerm$idvar, waves = simdatPerm$timeorder)
> zcor

[1] 0.125 0.500 0.250 0.125 0.125 0.500 0.125 0.250 0.125 0.125 0.125 0.125
[13] 0.125 0.500 0.125 0.125 0.125 0.500 0.250 0.250 0.250 0.125 0.125 0.500
[25] 0.500 0.125 0.250 0.125 0.125 0.125 0.125 0.125 0.125 0.125 0.125 0.125
[37] 0.500 0.500 0.250 0.250 0.500 0.125 0.250 0.250 0.125 0.125 0.125 0.125
[49] 0.125 0.500 0.125 0.125 0.500 0.250 0.125 0.125 0.125 0.125 0.500 0.250

```

Notice that `zcor` contains correlations between measurements within the same cluster. Hence if a cluster contains only one observation, then there will be generated no entry in `zcor` for that cluster. Now we can fit the model with:

```

> mod4 <- geeglm(yvar ~ tvar, id = idvar, data = simdatPerm, corstr = "fixed",
+   zcor = zcor)
> mod4

Call:
geeglm(formula = yvar ~ tvar, data = simdatPerm, id = idvar,
      zcor = zcor, corstr = "fixed")

Coefficients:
(Intercept)      tvar 
  1.001767      2.090944 

Degrees of Freedom: 30 Total (i.e. Null);  28 Residual

Scale Link:              identity
Estimated Scale Parameters: [1] 3.019607

Correlation: Structure = fixed   Link = identity
Estimated Correlation Parameters:
alpha:1
      1

Number of clusters:    6   Maximum cluster size: 5

```
