## 1 Introduction

This package provides a basic set of R functions for querying the Cancer Genomic Data Server (CGDS) hosted by the Computational Biology Center (cBio) at the Memorial Sloan-Kettering Cancer Center (MSKCC). This service is a part of the cBio Cancer Genomics Portal, <http://www.cbioportal.org/>.

In summary, the library can issue the following types of queries:

- `getCancerStudies()` : What cancer studies are hosted on the server? For example, TCGA glioblastoma or TCGA ovarian cancer.
- `getGeneticProfiles()` : What genetic profile types are available for cancer study X? For example, mRNA expression or copy number alterations.
- `getCaseLists()` : what case sets are available for cancer study X? For example, all samples or only samples corresponding to a given cancer subtype.

- `getProfileData()`: Retrieve slices of genomic data. For example, a client can retrieve all mutation data for PTEN and EGFR in TCGA glioblastoma.
- `getClinicalData()`: Retrieve clinical data (e.g. patient survival time and age) for a given cancer study and list of cases.

Each of these functions will be briefly described in the following sections. The last part of this document includes some concrete examples of how to access and plot the data.

The purpose of this document is to give the reader a quick overview of the `cgdsr` package. Please refer to the corresponding R manual pages for a more detailed explanation of arguments and output for each function.

## 2 The CGDS R interface

### 2.1 `CGDS()` : Create a CGDS connection object

Initially, we will establish a connection to the public CGDS server hosted by Memorial Sloan-Kettering Cancer Center. The function for creating a CGDS connection object requires the URL of the CGDS server service, in this case <http://www.cbioportal.org/public-portal/>, as an argument.

```
> library(cgdsr)
> # Create CGDS object
> mycgds = CGDS("http://www.cbioportal.org/public-portal/")
```

The variable `mycgds` is now a CGDS connection object pointing at the URL for the public CGDS server. This connection object must be included as an argument to all subsequent interface calls. Optionally, we can now perform a set of simple tests of the data returned from the CGDS connection object using the `test` function:

```
> # Test the CGDS endpoint URL using a few simple API tests
> test(mycgds)
```

```
getCancerStudies... OK
getCaseLists (1/2) ... OK
getCaseLists (2/2) ... OK
getGeneticProfiles (1/2) ... OK
getGeneticProfiles (2/2) ... OK
getClinicalData (1/1) ... OK
getProfileData (1/5) ... OK
getProfileData (2/5) ... OK
getProfileData (3/5) ... OK
getProfileData (4/5) ... OK
getProfileData (5/5) ... OK
```

## 2.2 `getCancerStudies()` : Retrieve a set of available cancer studies

Having created a CGDS connection object, we can now retrieve a data frame with available cancer studies using the `getCancerStudies` function:

```
> # Get list of cancer studies at server
> getCancerStudies(mycgds)[,c(1,2)]
```

87	Uterine Corpus Endometrial Carcinoma (TCGA, Provisional)
88	Uterine Corpus Endometrioid Carcinoma (TCGA, Nature 2013)

Here we are only showing the first two columns, the cancer study ID and short name, of the result data frame. There is also a third column, a longer description of the cancer study. The cancer study ID must be used in subsequent interface calls to retrieve case lists and genetic data profiles (see below).

### 2.3 `getGeneticProfiles()` : Retrieve genetic data profiles for a specific cancer study

This function queries the CGDS API and returns the available genetic profiles, e.g. mutation or copy number profiles, stored about a specific cancer study. Below we list the current genetic profiles for the TCGA glioblastoma cancer study:

```
> getGeneticProfiles(mycgds, 'gbm_tcga')[,c(1:2)]
```

```

      genetic_profile_id
1      gbm_tcga_mutations
2      gbm_tcga_RPPA_protein_level
3      gbm_tcga_methylation_hm450
4      gbm_tcga_methylation_hm27
5      gbm_tcga_log2CNA
6      gbm_tcga_rna_seq_v2_mrna
7 gbm_tcga_rna_seq_v2_mrna_median_Zscores
8      gbm_tcga_mrna_median_Zscores
9      gbm_tcga_mrna_U133_Zscores
10     gbm_tcga_mrna_U133
11     gbm_tcga_gistic
12     gbm_tcga_mrna
      genetic_profile_name
1      Mutations
2      protein/phosphoprotein level (RPPA)
3      Methylation (HM450)
4      Methylation (HM27)
5      Log2 copy-number values
6      mRNA expression (RNA Seq V2 RSEM)
7      mRNA Expression z-Scores (RNA Seq V2 RSEM)
8      mRNA Expression z-Scores (microarray)
9      mRNA Expression z-Scores (U133 microarray only)
10     mRNA expression (U133 microarray only)
11     Putative copy-number alterations from GISTIC
12     mRNA expression (microarray)

```

Here we are only listing the first two columns, genetic profile ID and short name, of the resulting data frame. Please refer to the R manual pages for a more extended specification of the arguments and output.

## 2.4 `getCaseLists()` : Retrieve case lists for a specific cancer study

This function queries the CGDS API and returns available case lists for a specific cancer study. For example, within a particular study, only some cases may have sequence data, and another subset of cases may have been sequenced and treated with a specific therapeutic protocol. Multiple case lists may be associated with each cancer study, and this method enables you to retrieve meta-data regarding all of these case lists. Below we list the current case lists for the TCGA glioblastoma cancer study:

```
> getCaseLists(mycgds, 'gbm_tcga')[,c(1:2)]
```

	case_list_id	case_list_name
1	gbm_tcga_3way_complete	All Complete Tumors
2	gbm_tcga_all	All Tumors
3	gbm_tcga_sequenced	Sequenced Tumors
4	gbm_tcga_cna	Tumors CNA
5	gbm_tcga_log2CNA	Tumors log2 copy-number

6	gbm_tcga_methylation_hm27	Tumors with methylation data (HM27)
7	gbm_tcga_methylation_hm450	Tumors with methylation data (HM450)
8	gbm_tcga_mrna	Tumors with mRNA data (Agilent microarray)
9	gbm_tcga_rna_seq_v2_mrna	Tumors with mRNA data (RNA Seq V2)
10	gbm_tcga_mrna_U133	Tumors with mRNA data (U133 microarray only)
11	gbm_tcga_rppa	Tumors with RPPA data
12	gbm_tcga_cnaseq	Tumors with sequencing and CNA data

Here we are only listing the first two columns, case list ID and short name, of the resulting data frame. Please refer to the R manual pages for a more extended specification of the arguments and output.

## 2.5 `getProfileData()` : Retrieve genomic profile data for genes and genetic profiles

The function queries the CGDS API and returns data based on gene(s), genetic profile(s), and a case list. The function only allows specifying a list of genes and a single genetic profile, or oppositely a single gene and a list of genetic profiles. Importantly, the format of the output data frame depends on if a single or a list of genes was specified in the arguments. Below we are retrieving mRNA expression and copy number alteration genetic profiles for the NF1 gene in all samples of the TCGA glioblastoma cancer study:

```
> getProfileData(mycgds, "NF1", c("gbm_tcga_gistic", "gbm_tcga_mrna"), "gbm_tcga_all")[c(1:5),]
      gbm_tcga_gistic gbm_tcga_mrna
TCGA.02.0001.01      -1          NA
TCGA.02.0003.01       0          NA
TCGA.02.0006.01       0          NA
TCGA.02.0007.01       0          NA
TCGA.02.0009.01       0          NA
```

We are here only showing the first five rows of the data frame. In the next example, we are retrieving mRNA expression data for the MDM2 and MDM4 genes:

```
> getProfileData(mycgds, c("MDM2", "MDM4"), "gbm_tcga_mrna", "gbm_tcga_all")[c(1:5),]
      MDM2 MDM4
TCGA.02.0001.01  NA  NA
TCGA.02.0003.01  NA  NA
TCGA.02.0006.01  NA  NA
TCGA.02.0007.01  NA  NA
TCGA.02.0009.01  NA  NA
```

We are again only showing the first five rows of the data frame.

## 2.6 `getClinicalData()` : Retrieve clinical data for a list of cases

The function queries the CGDS API and returns available clinical data (e.g. patient survival time and age) for a given case list. Results are returned in a

data frame with a row for each case and a column for each clinical attribute. The available clinical attributes are:

- `overall_survival_months`: Overall survival, in months.
- `overall_survival_status`: Overall survival status, usually indicated as "LIVING" or "DECEASED".
- `disease_free_survival_months`: Disease free survival, in months.
- `disease_free_survival_status`: Disease free survival status, usually indicated as "DiseaseFree" or "Recurred/Progressed".
- `age_at_diagnosis`: Age at diagnosis.

Below we retrieve clinical data for the TCGA ovarian cancer dataset (only first five cases/rows are shown):

```
> getClinicalData(mycgds, "ova_all")[c(1:5),]

data frame with 0 columns and 5 rows
```

### 3 Examples

#### 3.1 Example 1: Association of NF1 copy number alteration and mRNA expression in glioblastoma

As a simple example, we will generate a plot of the association between copy number alteration (CNA) status and mRNA expression change for the NF1 tumor suppressor gene in glioblastoma. This plot is very similar to Figure 2b in the TCGA research network paper on glioblastoma (McLendon et al. 2008). The mRNA expression of NF1 has been median adjusted on the gene level (by globally subtracting the median expression level of NF1 across all samples).

```
> df = getProfileData(mycgds, "NF1", c("gbm_tcga_gistic", "gbm_tcga_mrna"), "gbm_tcga_all")
> head(df)
```

	gbm_tcga_gistic	gbm_tcga_mrna
TCGA.02.0001.01	-1	NA
TCGA.02.0003.01	0	NA
TCGA.02.0006.01	0	NA
TCGA.02.0007.01	0	NA
TCGA.02.0009.01	0	NA
TCGA.02.0010.01	0	NA

```
> boxplot(df[,2] ~ df[,1], main="NF1 : CNA status vs mRNA expression", xlab="CNA status",
> stripchart(df[,2] ~ df[,1], vertical=T, add=T, method="jitter",pch=1,col='red')
```

Alternatively, the generic `cgdsr plot()` function can be used to generate a similar plot:

```
> plot(mycgds, "gbm_tcga", "NF1", c("gbm_tcga_gistic", "gbm_tcga_mrna"), "gbm_tcga_all", sk
[1] TRUE
```

### 3.2 Example 2: MDM2 and MDM4 mRNA expression levels in glioblastoma

In this example, we evaluate the relationship of MDM2 and MDM4 expression levels in glioblastoma. mRNA expression levels of MDM2 and MDM4 have been median adjusted on the gene level (by globally subtracting the median expression level of the individual gene across all samples).

```
> df = getProfileData(mycgds, c("MDM2", "MDM4"), "gbm_tcga_mrna", "gbm_tcga_all")
> head(df)
```

	MDM2	MDM4
TCGA.02.0001.01	NA	NA
TCGA.02.0003.01	NA	NA
TCGA.02.0006.01	NA	NA
TCGA.02.0007.01	NA	NA
TCGA.02.0009.01	NA	NA
TCGA.02.0010.01	NA	NA

```
> plot(df, main="MDM2 and MDM4 mRNA expression", xlab="MDM2 mRNA expression", ylab="MDM4 m
```

Alternatively, the generic `cgdsr plot()` function can be used to generate a similar plot:

```
> plot(mycgds, "gbm_tcga", c("MDM2","MDM4"), "gbm_tcga_mrna" ,"gbm_tcga_all")  
[1] TRUE
```

### 3.3 Example 3: Comparing expression of PTEN in primary and metastatic prostate cancer tumors

In this example we plot the mRNA expression levels of PTEN in primary and metastatic prostate cancer tumors.

```
> df.pri = getProfileData(mycgds, "PTEN", "prad_mskcc_mrna", "prad_mskcc_primary")
> head(df.pri)
```

	PTEN
PCA0001	9.467183
PCA0002	9.041528
PCA0003	8.511305
PCA0004	NA
PCA0005	9.413217
PCA0006	NA

```
> df.met = getProfileData(mycgds, "PTEN", "prad_mskcc_mrna", "prad_mskcc_mets")
> head(df.met)
```

	PTEN
PCA0182	7.486938
PCA0183	NA
PCA0184	7.578755
PCA0185	NA
PCA0186	NA
PCA0187	8.756132

```
> boxplot(list(t(df.pri),t(df.met)), main="PTEN expression in primary and metastatic tumor  
> stripchart(list(t(df.pri),t(df.met)), vertical=T, add=T, method="jitter",pch=1,col='red')
```
