1 Introduction

This package provides functions and graphical user interfaces for graph based multiple test procedures. These graphs define a weighting strategy for all subsets of null hypotheses and following the closed test procedure weighted tests can be performed on these subsets leading to a multiple test procedure controlling the family wise error rate in the strong sense. In some cases shortcuts are available, for example the weighted Bonferroni procedure leads to a sequentially rejective multiple test procedure.

At all steps either graphical user interfaces or the R Console with S4 objects and methods can be used.

Please note that this is still a beta release and the API will most likely still change in future versions.

1.1 Example and diving in

Let's start with a well-known procedure and see how it fits into this graphical approach to weighted multiple test procedures: The Bonferroni-Holm-Procedure [6].

Theorem 1.1 (Bonferroni-Holm-Procedure). *Let T_1, \dots, T_m be test statistics for $m \in \mathbb{N}$ null hypotheses H_1, \dots, H_m and p_1, \dots, p_m the associated p -values. Then the following test will control the familywise error rate at level $\alpha \in]0, 1[$ in the strong sense:*

Denote the ordered p -values by $p^{(1)} < p^{(2)} < \dots < p^{(m)}$ and the corresponding hypotheses by $H^{(1)}, H^{(2)}, \dots, H^{(m)}$.

Reject $H^{(1)}, H^{(2)}, \dots, H^{(j)}$ such that

$$p^{(i)} \leq \frac{\alpha}{n - i + 1} \quad \text{for all } 1 \leq i \leq j.$$

The corresponding graph for the Bonferroni-Holm-Procedure for three hypotheses is given in Figure 1. We see a fully connected graph, where each node represents a hypothesis and the nodes and edges have weights.

Figure 1: Graph representing the Bonferroni-Holm-Procedure for three hypotheses.

A null hypothesis can be rejected, when the p -value is less than the alpha level of the corresponding node. In this case the graph will be updated and the alpha level of this node is passed according to the edge weights.

Example 1.2. Let $p_1 = 0.01$, $p_2 = 0.04$ and $p_3 = 0.02$ be three p -values and $alpha = 0.05$. In the first step H_1 can be rejected since $p_1 < \alpha/3$. The updated graph can be seen in figure 2 and now also H_3 can be rejected since $p_1 < \alpha/2$. Again the graph is updated and at last also H_2 can be rejected.

Figure 2: Example showing how all three null hypotheses can be rejected with $p_1 = 0.01$, $p_2 = 0.04$ and $p_3 = 0.02$.

Okay, let's reproduce this with the **gMCP** package. We start R and enter:

```
> library(gMCP)
> graphGUI()
```

The GUI seen in Figure 8 is shown and we select from the menu "Example graphs" the entry "Bonferroni-Holm Test". We enter the three p-values in the respective fields on the right side. By clicking on the button with the green arrow we start the test procedure and can sequentially reject all three hypotheses.

If we don't want to use the GUI we can also use R:

```
> library(gMCP)
> graph <- createBonferroniHolmGraph(3)
> gMCP(graph, pvalues = c(0.01, 0.04, 0.02), alpha = 0.05)
```

gMCP-Result

Initial graph:

A graphMCP graph

H1 (not rejected, weight=0.3333)

H2 (not rejected, weight=0.3333)

H3 (not rejected, weight=0.3333)

Edges:

H1 $-(0.5) \rightarrow$ H2

H1 $-(0.5) \rightarrow$ H3

H2 $-(0.5) \rightarrow$ H1

H2 $-(0.5) \rightarrow$ H3

H3 $-(0.5) \rightarrow$ H1

H3 $-(0.5) \rightarrow$ H2

P-values:

H1 H2 H3

0.01 0.04 0.02

Adjusted p-values:

H1 H2 H3

0.03 0.04 0.04

Alpha: 0.05

Hypothesis rejected:

H1 H2 H3

TRUE TRUE TRUE

Final graph after 3 steps:

A graphMCP graph

H1 (rejected, weight=0)

H2 (rejected, weight=1)

H3 (rejected, weight=0)

No edges.

2 Creating the graph

In the first step a graph that describes the multiple test procedures must be created.

Figure 3: Example graph from [2] that we will create in this vignette.

2.1 Using R

We build upon the package `graph` [4], more precisely we declare a new class `graphMCP` that is a subclass of `graphNEL`. The `initialize` method of this subclass differs only in an extra argument `alpha`, the initial allocation of the significance level α to the individual hypotheses. Declaration of the nodes and edges is inherited from class `graphNEL`.

As an example we now create the graph from Bretz et al. [2] that you can see in figure 3.

```
> hnodes <- c("H11", "H21", "H31", "H12", "H22", "H32")
> weights <- c(1/3, 1/3, 1/3, 0, 0, 0)
> edges <- list()
> edges[["H11"]] <- list(edges = c("H21", "H12"), weights = c(1/2, 1/2))
> edges[["H21"]] <- list(edges = c("H11", "H31", "H22"), weights = c(1/3, 1/3, 1/3))
> edges[["H31"]] <- list(edges = c("H21", "H32"), weights = c(1/2, 1/2))
> edges[["H12"]] <- list(edges = "H21", weights = 1)
> edges[["H22"]] <- list(edges = c("H11", "H31"), weights = c(1/2, 1/2))
> edges[["H32"]] <- list(edges = "H21", weights = 1)
> graph <- new("graphMCP", nodes = hnodes, edgeL = edges, weights = weights)
```

Let's print the newly created graph:

```
> print(graph)

A graphMCP graph
H11 (not rejected, weight=0.3333)
H21 (not rejected, weight=0.3333)
H31 (not rejected, weight=0.3333)
H12 (not rejected, weight=0)
H22 (not rejected, weight=0)
H32 (not rejected, weight=0)
Edges:
H11 -(0.5)-> H21
H11 -(0.5)-> H12
H21 -(0.3333)-> H11
H21 -(0.3333)-> H31
H21 -(0.3333)-> H22
H31 -(0.5)-> H21
H31 -(0.5)-> H32
H12 -(1)-> H21
H22 -(0.5)-> H11
H22 -(0.5)-> H31
H32 -(1)-> H21
```

Since we also want to visualize the graph, we use the method `nodeRenderInfo` from package `graph` to set appropriate x- and y-coordinates in the `renderInfo`. (We are compatible to the `renderInfo` usage from package `Rgraphviz` [5].)

```
> nodeX <- c(H11 = 100, H21 = 300, H31 = 500, H12 = 100, H22 = 300, H32 = 500)
> nodeY <- c(H11 = 100, H21 = 100, H31 = 100, H12 = 300, H22 = 300, H32 = 300)
> nodeRenderInfo(graph) <- list(nodeX = nodeX, nodeY = nodeY)
```

Coordinates are interpreted as pixels in the GUI and big points in L^AT_EX (72 bp = 1 inch).

Let's take a look at the graph in L^AT_EX rendered with TikZ [8] (you can see the compiled result in figure 3):

```
> cat(graph2latex(graph))

\begin{tikzpicture}[scale=1]
\node (H11) at (100bp,-100bp)[draw,circle split,fill=green!80] {$H11$ \nodepart{lower} $\frac{1}{3}\alpha$};
\node (H21) at (300bp,-100bp)[draw,circle split,fill=green!80] {$H21$ \nodepart{lower} $\frac{1}{3}\alpha$};
\node (H31) at (500bp,-100bp)[draw,circle split,fill=green!80] {$H31$ \nodepart{lower} $\frac{1}{3}\alpha$};
\node (H12) at (100bp,-300bp)[draw,circle split,fill=green!80] {$H12$ \nodepart{lower} $0$};
\node (H22) at (300bp,-300bp)[draw,circle split,fill=green!80] {$H22$ \nodepart{lower} $0$};
\node (H32) at (500bp,-300bp)[draw,circle split,fill=green!80] {$H32$ \nodepart{lower} $0$};
\draw [->,line width=1pt] (H11) to[bend left=15] node[near start,above,fill=blue!20] {$\frac{1}{2}$} (H21);
```

```

\draw [->,line width=1pt] (H11) to[auto] node[near start,above,fill=blue!20] { $\frac{1}{2}$ } (H12);
\draw [->,line width=1pt] (H21) to[bend left=15] node[near start,above,fill=blue!20] { $\frac{1}{3}$ } (H11);
\draw [->,line width=1pt] (H21) to[bend left=15] node[near start,above,fill=blue!20] { $\frac{1}{3}$ } (H31);
\draw [->,line width=1pt] (H21) to[auto] node[near start,above,fill=blue!20] { $\frac{1}{3}$ } (H22);
\draw [->,line width=1pt] (H31) to[bend left=15] node[near start,above,fill=blue!20] { $\frac{1}{2}$ } (H21);
\draw [->,line width=1pt] (H31) to[auto] node[near start,above,fill=blue!20] { $\frac{1}{2}$ } (H32);
\draw [->,line width=1pt] (H12) to[auto] node[near start,above,fill=blue!20] {1} (H21);
\draw [->,line width=1pt] (H22) to[auto] node[near start,above,fill=blue!20] { $\frac{1}{2}$ } (H11);
\draw [->,line width=1pt] (H22) to[auto] node[near start,above,fill=blue!20] { $\frac{1}{2}$ } (H31);
\draw [->,line width=1pt] (H32) to[auto] node[near start,above,fill=blue!20] {1} (H21);
\end{tikzpicture}

```

We can even change the position of the edge labels for further fine tuning of the graphical representation. With the following command we place the label for the edge from H1 to H2 at position (200, 80):

```

> edgeData(graph, "H11", "H21", "labelX") <- 200
> edgeData(graph, "H11", "H21", "labelY") <- 80

```

2.1.1 graph2matrix and matrix2graph

We can also construct a graph from a given adjacency matrix via the command `matrix2graph`:

```

> m <- matrix(rep(1/3, 16), nrow = 4)
> diag(m) <- c(0, 0, 0, 0)
> graph <- matrix2graph(m)
> print(graph)

```

```

A graphMCP graph
H1 (not rejected, weight=0.25)
H2 (not rejected, weight=0.25)
H3 (not rejected, weight=0.25)
H4 (not rejected, weight=0.25)
Edges:
H1 -(0.3333)-> H2
H1 -(0.3333)-> H3
H1 -(0.3333)-> H4
H2 -(0.3333)-> H1
H2 -(0.3333)-> H3
H2 -(0.3333)-> H4
H3 -(0.3333)-> H1
H3 -(0.3333)-> H2
H3 -(0.3333)-> H4
H4 -(0.3333)-> H1
H4 -(0.3333)-> H2
H4 -(0.3333)-> H3

```

```

> graph2matrix(graph)

```

```

      H1      H2      H3      H4
H1 0.0000 0.3333 0.3333 0.3333
H2 0.3333 0.0000 0.3333 0.3333
H3 0.3333 0.3333 0.0000 0.3333
H4 0.3333 0.3333 0.3333 0.0000

```

2.2 Using the GUI

The creation of `graphMCP` objects is very straight forward, but still takes some time and typos may occur. More convenient for the average user is the use of the graphical user interface for creating and editing MCP graphs that the `gMCP` package includes.

It is called by the command `graphGUI()` and takes as optional argument a variable name, given as a character string, of the graph to edit or under which a newly created `graphMCP` object will be available from the R command line.

```

> graphGUI("graph")

```

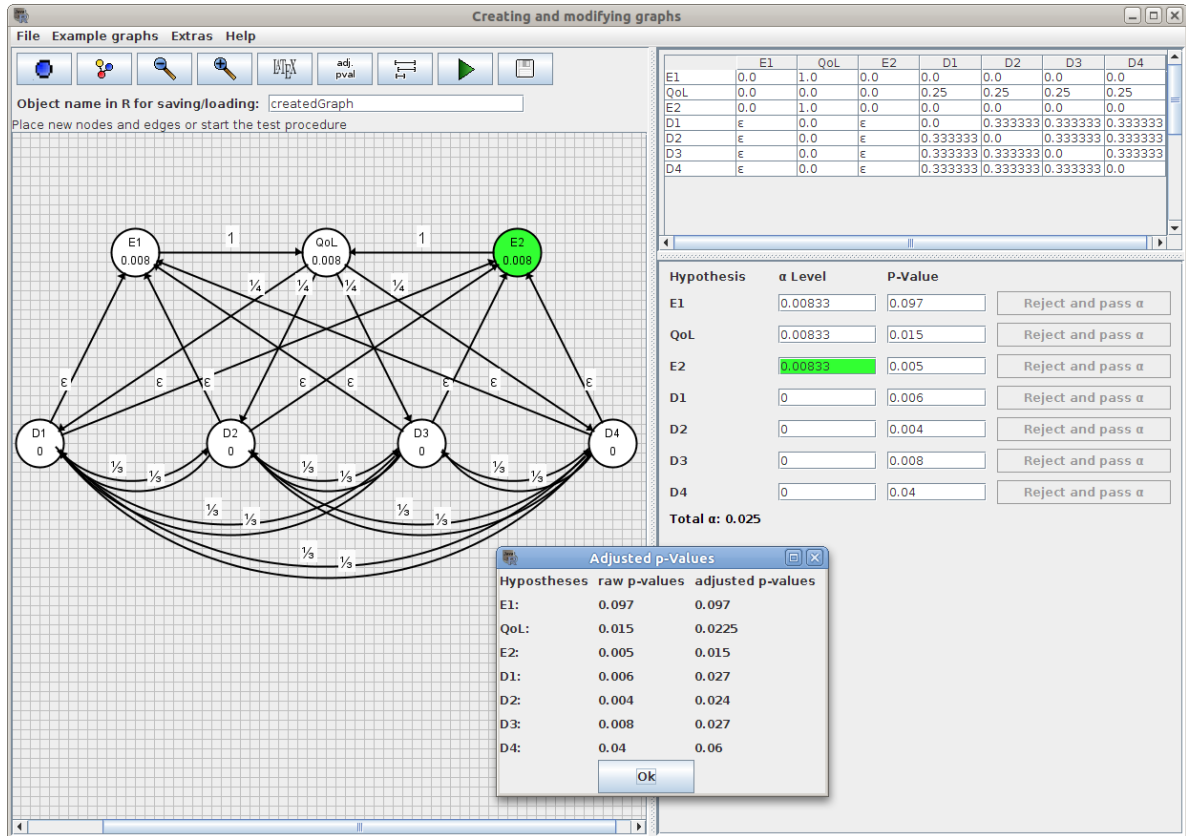

Figure 4: The graphical user interface allows testing, calculation of confidence intervals and adjusted p-values.

Let's take a look at the icon panel:

-  This button lets you add a new node to the graph. After pressing the button click somewhere on the graph panel and a new node will appear at this place.
 -  This button lets you add a new edge between two nodes. After pressing the button click on the node the edge should start and after that on the node the edge should end.
 -  For really big graphs the ability to zoom in and out is usefull.
 -  This button exports the graph as an \LaTeX TikZ picture.
 -  Calculates the adjusted p-values.
 -  Calculates simultaneous confidence intervals.
 -  Starts the testing procedure / goes back to the graph modification.
 -  This button exports the graph back to R under the variable name in the adjacent text field.
- With drag and drop you can move nodes and also adjust edges.

3 The sequentially rejective MTP

For a full description of the sequentially rejective multiple testing procedure take a look at Bretz et al. [1].

3.1 Using R

You can either specify each rejection step yourself or simply use the method `gMCP`:

```
> graph <- createGraphFromBretzEtAl()
> # We can reject a single node:
> print(rejectNode(graph, "H11"))
```

```
A graphMCP graph
H11 (rejected, weight=0)
H21 (not rejected, weight=0.5)
H31 (not rejected, weight=0.3333)
H12 (not rejected, weight=0.1667)
H22 (not rejected, weight=0)
H32 (not rejected, weight=0)
Edges:
H21 -(0.4)-> H31
H21 -(0.4)-> H22
H21 -(0.2)-> H12
H31 -(0.5)-> H21
H31 -(0.5)-> H32
H12 -(1)-> H21
H22 -(0.5)-> H31
H22 -(0.25)-> H21
H22 -(0.25)-> H12
H32 -(1)-> H21
```

```
> # Or given a vector of pvalues let the function gMCP do all the work:
> pvalues <- c(0.1, 0.008, 0.005, 0.15, 0.04, 0.006)
> result <- gMCP(graph, pvalues)
> print(result)
```

`gMCP-Result`

Initial graph:

```
A graphMCP graph
H11 (not rejected, weight=0.3333)
H21 (not rejected, weight=0.3333)
H31 (not rejected, weight=0.3333)
H12 (not rejected, weight=0)
H22 (not rejected, weight=0)
H32 (not rejected, weight=0)
Edges:
H11 -(0.5)-> H21
H11 -(0.5)-> H12
H21 -(0.3333)-> H11
H21 -(0.3333)-> H31
H21 -(0.3333)-> H22
H31 -(0.5)-> H21
H31 -(0.5)-> H32
H12 -(1)-> H21
H22 -(0.5)-> H11
H22 -(0.5)-> H31
H32 -(1)-> H21
```

P-values:

H11	H21	H31	H12	H22	H32
0.100	0.008	0.005	0.150	0.040	0.006

Adjusted p-values:

H11	H21	H31	H12	H22	H32
0.1200	0.0160	0.0150	0.1500	0.1200	0.0225

Alpha: 0.05

Hypothesis rejected:

H11	H21	H31	H12	H22	H32
FALSE	TRUE	TRUE	FALSE	FALSE	TRUE

Final graph after 3 steps:

```
A graphMCP graph
Sum of weight: 1
H11 (not rejected, weight=0.6667)
```

```

H21 (rejected, weight=0)
H31 (rejected, weight=0)
H12 (not rejected, weight=0)
H22 (not rejected, weight=0.3333)
H32 (rejected, weight=0)
Edges:
H11 -(0.6667)-> H12
H11 -(0.3333)-> H22
H12 -(0.5)-> H11
H12 -(0.5)-> H22
H22 -(1)-> H11
>

```

We can create a TikZ graphic from the last graph with `graph2latex(result@graphs[[4]])` that is shown in figure 5.

Figure 5: Final graph from the test procedure after rejection of H_{21} , H_{31} and H_{32} .

The command `gMCPReport` generates a full report of the testing procedure:

```

> gMCPReport(result, "Report.tex")

```

3.1.1 Adjusted p-values and simultaneous confidence intervals

Also adjusted p-values and simultaneous confidence intervals can be computed.

Let's assume the tests for hypotheses $H1 : \theta_1 = 0$, $H2 : \theta_2 = 0$ and $H3 : \theta_3 = 0$ are three t-tests with degree of freedom 9. The estimates are $\hat{\theta}_1 = 1.071$, $\hat{\theta}_2 = 0.5575$ and $\hat{\theta}_3 = 1.686$, the sample standard deviations $s_1 = 1.2$, $s_2 = 0.8$ and $s_3 = 1.7$ the t-statistics 2.821, 2.204 and 3.136 and the corresponding p-values $p_1 = 0.02$, $p_2 = 0.055$ and $p_3 = 0.012$. We want to adjust for multiple testing by using the Bonferroni-Holm-Procedure.

```

> # Estimates:
> est <- c("H1"=0.9101444, "H2"=0.4485153, "H3"=1.4568271)
> # Sample standard deviations:
> ssd <- c("H1"=1.2, "H2"=0.8, "H3"=1.7)
> simConfint(createBonferroniHolmGraph(3),
+             pvalues = c(0.02,0.055,0.012),
+             confint = function(node, alpha) {
+               est[node]+c(-1,1)*qt(1-alpha/2,df=9)*ssd[node]/sqrt(10)
+             })

  lower bound upper bound
H1      -Inf      Inf
H2    0.4485    0.4485
H3      -Inf      Inf
>

```

3.2 Using the GUI

Use the following two buttons:

See [3].

Figure 6: You can also specify a correlation between the tests.

4 Options and Export

4.1 Options

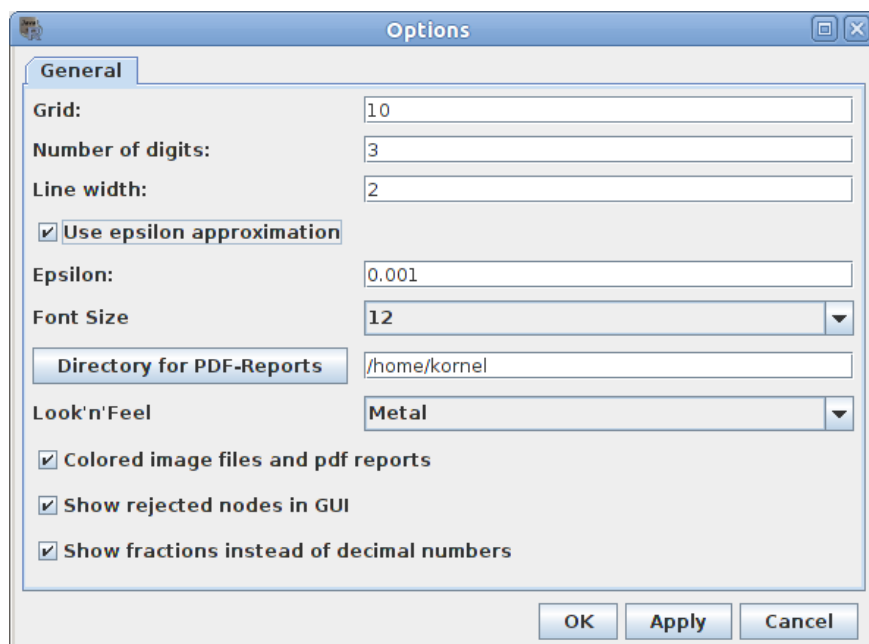

Figure 7: You can configure many things in the option dialog.

4.2 PNG export

5 Important TikZ commands for optimizing the reports

A clear automatic placement of edges and weight labels without overlapping is a very difficult task and for complicated graphs the `gMCP` package will often fail to accomplish this. There is the possibility to adjust the edges and labels in the GUI, but since the `LATEX` graph layout is not (yet) exactly the same, there is perhaps the need for adjusting the graphs in the TikZ code. The TikZ

You can change the position where the edge weight label is placed to `at start`, `very near start`, `near start`, `midway`, `near end`, `very near end` and `at end` or simply use something like `pos=0.5`. If you add an argument `sloped`, the text label will be rotated so that a parallel line to the base line becomes a tangent to the edge.

Often it is useful to reduce the bending angle in `[bend left=15]` below 15. You could also specify and change `out=15` and `in=165` separately.

A powerful feature is the use of styles, since this will effect all objects of a given class. But for this please take a look directly at the TikZ manual [8].
