Package 'AIGENIE'

September 8, 2026

Type Package

Title Automatic Item Generation and Validation via Network-Integrated Evaluation

Version 2.1.2

Date 2026-08-26

Maintainer Hudson Golino <hfg9s@virginia.edu>

Description Automated psychological scale development and structural validation using large language models (LLMs) and network psychometric methods. Implements the AI-GENIE framework (Automatic Item Generation and Validation via Network-Integrated Evaluation) to generate candidate items, compute embedding representations, and estimate dimensional structure using Exploratory Graph Analysis (EGA). Item quality is evaluated using Unique Variable Analysis to identify redundant items and Bootstrap EGA to assess item and dimension stability. Supports both fully automated item generation and analysis of user-provided item sets, facilitating efficient, theory-informed measurement development prior to empirical data collection.

`AIGENIE` *Generate, Validate, and Check Items using AI-GENIE*

Description

Generate, validate, and check your items for quality and redundancy using AI-GENIE (Generative Psychometrics via AI-GENIE: Automatic Item Generation and Validation via Network-Integrated Evaluation). AI-GENIE is a methodology that combines the latest open-source LLMs and generative artificial intelligence with advances in network psychometrics to facilitate scale generation, selection, and validation. The pipeline eliminates the need to generate hundreds of items by content experts, recruit diverse and experienced researchers, administer items to thousands of participants, and employ modern psychometric methods in the collected data.

Usage

```
AIGENIE(
  item.attributes,
  openai.API = NULL,
  hf.token = NULL,
  main.prompts = NULL,
  groq.API = NULL,
  anthropic.API = NULL,
  jina.API = NULL,
  model = "gpt4o",
```

```
  temperature = 1,
  top.p = 1,
  embedding.model = "text-embedding-3-small",
  target.N = NULL,
  domain = NULL,
  scale.title = NULL,
  item.examples = NULL,
  audience = NULL,
  item.type.definitions = NULL,
  response.options = NULL,
  prompt.notes = NULL,
  system.role = NULL,
  EGA.model = NULL,
  EGA.algorithm = NULL,
  EGA.uni.method = NULL,
  uva.cut.off = 0.2,
  boot.iter = 500,
  ncores = NULL,
  keep.org = FALSE,
  items.only = FALSE,
  embeddings.only = FALSE,
  adaptive = TRUE,
  run.overall = FALSE,
  all.together = FALSE,
  plot = TRUE,
  silently = FALSE
)
```

Arguments

`item.attributes`
: A named list of atomic character vectors (required). Describes the attributes or characteristics that each item type should encompass. These are not necessarily lower-order dimensions, but can be if the item types represent appropriate hierarchical constructs. Each nested list must have at least two unique attributes. Repeated attributes within the same nested list are not allowed, but attributes can be repeated across nested lists. Each name of the list must be unique, and all elements within sublists must be strings. For example, attributes of the personality trait "neuroticism" might include "anxious", "depressed", "insecure", or "emotional" since these characteristics encompass aspects of neuroticism that the item pool should address.

`openai.API`
: A character string or NULL (optional, default: NULL). The OpenAI API key for authentication with OpenAI's services. Required when using OpenAI's platform for either item generation or embedding. If NULL, users must provide either `groq.API` for item generation via Groq or `hf.token` for embeddings via Hugging Face.

`hf.token`
: A character string or NULL (optional, default: NULL). The Hugging Face API token for authentication with Hugging Face services. Required when using Hug-

ging Face models for embeddings. If NULL, an `openai.API` key must be provided since the user will need to embed via OpenAI.

`main.prompts` A named list of character strings or NULL (optional, default: NULL). Custom prompts for item generation. If provided, this must be a named list where `names(main.prompts)` equals `names(item.attributes)`. Each prompt must explicitly mention all attributes found in the associated element of `item.attributes`. Users should not include instructions regarding layout/formatting of LLM response, as this is handled automatically for proper parsing. If NULL, AIGENIE builds appropriate prompts automatically based on other prompt-building parameters.

`groq.API` A character string or NULL (optional, default: NULL). The Groq API key for authentication with Groq's LLM services. Required when users want to generate items via Groq's API platform using open-source models. Commonly used in combination with `openai.API` since Groq does not provide embedding services.

`anthropic.API` A character string or NULL (optional, default: NULL). The Anthropic API key for authentication with Anthropic's Claude models. Required when using Claude models (e.g., "sonnet", "opus", "haiku") for item generation. Get a key at https://platform.claude.com/docs/en/manage-claude/authentication.

`jina.API` A character string or NULL (optional, default: NULL). The Jina AI API key for authentication with Jina's embedding services. Required when using Jina embedding models (e.g., "jina-embeddings-v3", "jina-embeddings-v4"). Free tier available at https://jina.ai/.

`model` A character string (optional, default: "gpt4o"). Specifies which large language model to use for item generation. Supports models from multiple providers:

- **OpenAI**: `"gpt-4o"`, `"gpt-4"`, `"gpt-3.5-turbo"`, `"o1"`, `"o1-mini"`
- **Anthropic**: `"sonnet"`, `"opus"`, `"haiku"`, or full names like `"claude-sonnet-4-5-20250929"`
- **Groq**: `"llama-3.3-70b-versatile"`, `"mixtral-8x7b-32768"`, `"gemma2-9b-it"`, `"deepseek-r1-distill-llama-70b"`, `"qwen-2.5-72b"`

Aliases like `"llama"`, `"mixtral"`, `"gemma"`, `"deepseek"`, `"claude"` are also accepted. The function automatically determines which API service to use based on the model name and available API keys.

`temperature` A numeric value (optional, default: 1). Controls the randomness and creativity of the LLM's item generation. Must be between 0-2, where lower values produce more deterministic outputs and higher values increase creativity and variability.

`top.p` A numeric value (optional, default: 1). Controls nucleus sampling for the LLM's text generation. Must be between 0-1, where lower values make the model more focused and higher values allow more diverse outputs. Can be used in conjunction with `temperature`.

`embedding.model`

A character string (optional, default: "text-embedding-3-small"). Specifies which model to use for generating embeddings of items. Supports multiple providers:

- **OpenAI**: `"text-embedding-3-small"`, `"text-embedding-3-large"`, `"text-embedding-ada-00`
- **Jina AI**: `"jina-embeddings-v3"`, `"jina-embeddings-v4"`, `"jina-embeddings-v2-base-en"` (requires `jina.API`)

- **HuggingFace**: "BAAI/bge-small-en-v1.5", "BAAI/bge-base-en-v1.5", "thenlper/gte-base", "sentence-transformers/all-MiniLM-L6-v2"

The provider is automatically detected based on the model name. Jina models support task adapters and Matryoshka dimension truncation for optimized embeddings.

target.N An integer, named list of integers, or NULL (optional, default: NULL). Specifies the number of items to generate for each item type. Can be a single integer (applies to all item types) or a named list of integers where names(target.N) equals names(item.attributes) for different numbers per item type. If NULL, 60 items per item type will be generated. A rule of thumb is about 60 items or more per item type for meaningful reduction analysis.

domain A character string or NULL (optional, default: NULL). Specifies the psychological or research domain for context in item generation. Should be specific (e.g., "personality", "child development") rather than general. If supplied, it will be used to construct appropriate prompts and system roles unless system.role is provided.

scale.title A character string or NULL (optional, default: NULL). Specifies the name or title of the scale being developed. Can be formal or descriptive, but more specific titles generally produce better results. If supplied, it will be used to construct appropriate prompts and system roles unless system.role is provided.

item.examples A data frame or NULL (optional, default: NULL). Provides example items to guide the LLM's generation style and format. Must be a data frame with columns: statement (the actual item), attribute (the item's attribute), and type (the item's type). All values must be non-empty strings, and the attribute and type must align with the item.attributes object. Items should be extremely high quality and validated if possible, as they serve as style templates.

audience A character string or NULL (optional, default: NULL). Specifies the target population for the scale being developed. Should be as specific as possible (e.g., "educated adults in rural America", "children with ASD in second grade") rather than general demographic categories. If supplied, it will be used to construct appropriate prompts and system roles unless system.role is provided.

item.type.definitions

A named list of character strings or NULL (optional, default: NULL). Provides definitions or descriptions of each item type for the LLM. Must be a named list where names(item.type.definitions) equals names(item.attributes). Useful when constructs or item types are obscure or potentially ambiguous, helping the LLM understand the item type or construct in your specific context. If supplied, it will be used to construct appropriate prompts and system roles unless system.role is provided.

response.options

A character vector or NULL (optional, default: NULL). Specifies the response scale labels for the generated items (e.g., c("agree", "neither agree nor disagree", "disagree")). These labels provide context for item writing but do not appear in the actual items themselves. If supplied, it will be used to construct appropriate system roles unless system.role is provided.

prompt.notes A named list of character strings, character string, or NULL (optional, default: NULL). Allows users to add custom instructions or context to the prompts. Can

be a named list where `names(prompt.notes)` equals `names(item.attributes)` for different notes per item type, or a single string applied to all item types. These notes are appended at the end of constructed prompts, allowing users to add brief additional requirements (e.g., "All items MUST begin with the stem 'I am someone who...'") without creating entirely custom prompts. Should be brief; otherwise, users should consider using `main.prompts`.

`system.role` A character string or NULL (optional, default: NULL). Defines the system role/persona for the LLM during item generation. If not provided, one is built automatically based on prompt-building parameters. Should be as specific as possible (e.g., "You are an expert scale developer and psychometrician with extensive expertise in drafting Likert-type items for children with ASD. Today, you will focus on developing robust, single-statement items that assess linguistic ability."). Applies to all LLM interactions.

`EGA.model` A character string or NULL (optional, default: NULL). Specifies which model to use for Exploratory Graph Analysis network construction. Valid options are "tmfg" or "glasso". If NULL, AIGENIE will test both "tmfg" and "glasso" models and automatically return the model that maximizes NMI (normalized mutual information). TMFG is a greedy but speedy network-building algorithm that works well for many applications, especially text. EBICglasso is slower but non-greedy and may capture more nuanced relationships.

`EGA.algorithm` A character string (optional, default is "walktrap" when there is a single trait and "louvain" when there is more than one trait). Specifies which community detection algorithm to use within the EGA framework. Valid options are "louvain", "walktrap", or "leiden". The algorithm operates separately from the network building specified by `EGA.model`.

`EGA.uni.method` A character string (optional, default: "louvain"). Specifies the method for handling unidimensional structures in EGA. Valid options are: "expand" (expands correlation matrix with four variables correlated 0.50; if dimensions ≤ 2, data are unidimensional), "LE" (applies Leading Eigenvector algorithm; if dimensions = 1, uses LE solution), or "louvain" (applies Louvain algorithm; if dimensions = 1, uses Louvain solution). This parameter is rarely modified by users.

`uva.cut.off` A numeric value in `[0, 1)` (optional, default: `0.20`). The weighted topological overlap threshold passed to `EGAnet::UVA` during the redundancy-reduction step. Items with pairwise wTO at or above this value are flagged as redundant. Lower values are more aggressive (remove more items); higher values are more conservative.

`boot.iter` A positive integer (optional, default: 500). Number of bootstrap iterations used by `EGAnet::bootEGA` during item-stability analyses and iterative stability filtering.

`ncores` A positive integer or `NULL` (optional, default: `NULL`). Number of processing cores passed to `EGAnet::bootEGA`. When `NULL`, AIGENIE does not pass an `ncores` argument, preserving the current default behavior of `EGAnet::bootEGA`.

`keep.org` A logical value (optional, default: FALSE). Controls whether the pre-reduced items generated by the model are returned to the user. If TRUE, returns the full item pool before psychometric reduction. Does not affect the reduction process.

`items.only` A logical value (optional, default: FALSE). Controls whether the function only generates items without running the full psychometric pipeline. If TRUE, skips embedding, EGA, and reduction steps, returning only a data frame with columns `ID`, `statement`, `type`, and `attribute`. Useful when users want to generate items with AIGENIE, embed them elsewhere, and use the `GENIE` function for reduction.

`embeddings.only` A logical value (optional, default: FALSE). Controls whether the function generates items and embeddings but skips psychometric reduction. If TRUE, returns a named list with `embeddings` (the embedding matrix) and `items` (the items data frame). If both `items.only` and `embeddings.only` are TRUE, defaults to `embeddings.only` behavior.

`adaptive` A logical value (optional, default: TRUE). Controls whether previously generated items are incorporated into subsequent prompts to reduce redundancy. Items are generated in batches to avoid context window limitations, potentially requiring multiple API calls. When TRUE, appends previously generated items so the model knows what has been generated to avoid repetition. Should always be enabled unless context limitations are a concern.

`run.overall` A logical value (optional, default: FALSE). Controls whether a *fit* analysis on the complete item pool is run *post-reduction.* By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is `TRUE`, an additional analysis is run on the overall sample, but no further reductions at the overall level are made. If only one item type is present, this argument will be ignored.

`all.together` A logical value (optional, default: FALSE). Controls whether the *reduction* analysis on the complete item pool is run. By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is `TRUE`, reductions are made at the overall level (i.e., all items go through the reduction pipeline together, agnostic of item type). If only one item type is present, this argument will be ignored.

`plot` A logical value (optional, default: TRUE). Controls whether visualizations are generated and displayed. When TRUE, generates EGA network comparison plots (before vs after reduction) for each item type and the sample overall. Plots are always saved and returned in the output object but can be suppressed from display for cleaner output.

`silently` A logical value (optional, default: FALSE). Controls console output and messaging during function execution. When TRUE, suppresses progress statements about item generation, embedding, and pipeline reduction. Does not affect warnings or errors, only informational messages. Operates independently of the `plot` parameter.

Value

The structure of the return value depends on the function flags.

Defaults: `items.only` = `FALSE`, `embeddings.only` = `FALSE`, `run.overall` = `FALSE`, `keep.org` = `FALSE`, `all.together` = `FALSE`.

When `items.only = TRUE`**:** Returns a `data.frame` of generated items with columns: `ID`, `statement`, `type`, and `attribute`.

When `embeddings.only = TRUE`**:** Returns a named `list` with two elements:

- `embeddings` — an embedding matrix/list (columns or rownames correspond to item IDs).
- `items` — the items `data.frame` described above.

Default behaviour (`items.only = FALSE`, `embeddings.only = FALSE`, `run.overall = FALSE`, `keep.org = FALSE`, `all.together = FALSE`): Returns a named `list` with two top-level elements:

`item_type_level` A named list where each name is an item type and each element is a per-type named list containing:

- `final_NMI` Numeric: final normalized mutual information after reduction.
- `initial_NMI` Numeric: initial NMI of the pre-reduced item pool.
- `embeddings` List or matrix of embeddings for this item type (see 'Notes on `embeddings`' below).
- `UVA` List from Unique Variable Analysis (contains at least `n_removed`, `n_sweeps`, `redundant_pairs` data.frame).
- `bootEGA` List with bootEGA results (e.g. `initial_boot`, `final_boot`, `n_removed`, `items_removed`, `initial_boot_with_redundancies`).
- `EGA.model_selected` Character: chosen EGA model (e.g. `"TMFG"` or `"Glasso"`).
- `final_items` `data.frame`: final items after reduction (columns include `ID`, `statement`, `attribute`, `type`, `EGA_com`).
- `final_EGA` EGA object (from EGAnet) after reduction.
- `initial_EGA` Initial EGA object computed on the pre-reduced item set.
- `start_N` Integer: initial number of items in this type.
- `final_N` Integer: final number of items in this type.
- `network_plot` `ggplot` / `patchwork` object comparing networks before vs after reduction.
- `stability_plot` `ggplot` / `patchwork` object showing item stability before vs after reduction.

`overall` Named list with aggregated results across all item types. Under the default this contains:

- `final_items` `data.frame` of final items across all types (columns as above).
- `embeddings` Embeddings for the full reduced item set (see 'Notes on `embeddings`' below). Note: `overall$embeddings` does **not** include `selected`.

When `keep.org = TRUE` (in addition to defaults above): The top-level shape remains (`item_type_level` and `overall`) but includes original (pre-reduction) information:

`item_type_level` Each per-type sublist contains: `final_NMI`, `initial_NMI`, `embeddings`, `UVA`, `bootEGA`, `EGA.model_selected`, `final_items`, `initial_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, `network_plot`, `stability_plot`.

`overall` Contains `final_items`, `initial_items`, and `embeddings` for the full item pool.

For `keep.org = TRUE`, per-type `embeddings` contains at least: `full_org`, `sparse_org`, `selected`, `full`, and `sparse`. (`overall$embeddings` contains the same subcomponents **except** `selected` is omitted.)

When `run.overall = TRUE` (`items.only = FALSE`, `embeddings.only = FALSE`):

`item_type_level` Same per-type structure as the default (see above).

`overall` A named list with aggregated results (not limited to `final_items` and `embeddings`) containing: `final_NMI`, `initial_NMI`, `embeddings`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, and `network_plot`.

When `all.together = TRUE` (regardless of `run.overall`): Results are **not** split into `item_type_level` and `overall`. Instead the function returns a single named list (applies to the full — possibly `keep.org` modified — result set) containing: `final_NMI`, `initial_NMI`, `embeddings`, `UVA`, `bootEGA`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, `network_plot`, and `stability_plot`.

## End(Not run)
```

`build_item_attributes_from_items` *Build item.attributes Object from Items Data Frame*

Description

Reverse engineers the `item.attributes` object structure required by AIGENIE from a validated items data frame. This allows GENIE to work with user-provided items by reconstructing the expected attribute structure.

Usage

```
build_item_attributes_from_items(items)
```

Arguments

`items`	A validated data frame with columns: statement, attribute, type, ID (already processed by items_validate_GENIE)

Value

A named list where:

- Names are the unique item types from items$type
- Each element is a character vector of unique attributes for that type
- All values are normalized (lowercase, trimmed) to match AIGENIE expectations

---

`chat` *Chat with an LLM via API Calls*

Description

Send one or more prompts to a remote large-language model (LLM) using the appropriate provider API (OpenAI, Hugging Face, Groq, or Anthropic). A valid API key for at least one provider is required. To use a local model (no API call), see `local_chat()`.

Usage

```
chat(
  prompts,
  model,
  system.role = NULL,
  openai.API = NULL,
  hf.token = NULL,
  groq.API = NULL,
  anthropic.API = NULL,
  reps = 1,
```

```
  top.p = 1,
  temperature = 1,
  max.tokens = 2048L,
  silently = FALSE
)
```

Arguments

prompts	A character string or character vector. The main prompt(s) given to the model. If multiple prompts are supplied, each will be sent separately to the model.
model	A character string specifying the LLM model name (e.g., "gpt4o"). The model must correspond to the API key provided.
system.role	A character string or character vector, default NULL. The system role(s) (model persona). If only one system role is provided and multiple prompts are supplied, the same role will be used for each prompt. If multiple system roles are provided, they should align with the prompts.
openai.API	A character string, default NULL. Your OpenAI API key (required when using an OpenAI model).
hf.token	A character string, default NULL. Your Hugging Face token (required when using a Hugging Face-hosted model).
groq.API	A character string, default NULL. Your Groq API key (required when using a Groq-hosted model).
anthropic.API	A character string, default NULL. Your Anthropic API key (required when using an Anthropic model).
reps	Integer, default 1. The number of times each prompt will be given to the model.
top.p	Numeric, default 1. Top-p (nucleus) sampling parameter.
temperature	Numeric, default 1. Sampling temperature controlling response randomness.
max.tokens	Integer, default 2048L. Maximum number of tokens requested from the model.
silently	Logical, default FALSE. If FALSE, progress messages are printed. If TRUE, the function runs quietly.

Details

The function includes a retry mechanism (up to 5 attempts) for transient API failures. If all attempts fail, the function stops with an informative error.

Value

A data.frame with one row per API call (i.e., per prompt × repetition) containing:

- rep — repetition index
- prompt — the prompt text sent to the model
- response — the raw text response returned by the model

Important

This function requires a valid API key corresponding to the selected model. Network access is required. For local (non-API) models, use `local_chat()`.

local_chat

Examples

```
## Not run:
################################################
### Example 1: Writing a Very Basic Prompt  #####
################################################

# First, define your API key
key <- "INSERT YOUR KEY HERE"
# Then, define your LLM model. This model should correspond to your API key.
model <- "gpt4o" # in this example, you would need an OpenAI API key.

# Then, write your prompt. This will be given to the model directly.
prompt <- "Why does the planet Saturn have rings? Give a 100 word explanation."

# Optionally, add a system role (a model persona)
system.role <- "You specialize in tutoring astronomy for high school students."

# Add the number of prompt repetitions. By default, this is set to 1. But it
# may bu useful to increase the number of repetitions to get a sense of how
# consistent your output might be.
reps <- 3

# Now you are ready to chat with an LLM
first_chat <- chat(
  # Set your own API key. If you are not using OpenAI, change the 1st
  # argument to match your API key. Choices are `hf.token`, `groq.API`,
  # `anthropic.API`, and `openai.API`. In this example, I'm using
  # `openai.API` since I want to chat with a GPT model.
  openai.API = key,
  model = model, # Ensure your model corresponds to your API key.
  prompts = prompt,
  system.role = system.role,
  reps = reps
)

# Check how the output changes from iteration to iteration
first_chat$response[[1]] # first iteration output
first_chat$response[[2]] # second iteration output
first_chat$response[[2]] # third iteration output

#####################################################################
### Example 2: Send multiple prompts in a single function call #####
```

```
######################################################################

# You are also able to send more than one prompt in a single call
# Let's pull the first prompt from Example 1:
prompt1 <- "Why does the planet Saturn have rings? Give a 100 word explanation."
prompt2 <- "Which planet is the hottest in our solar system? How do we know?"

# Aggregate the prompts in a single object
prompts <- c(prompt1, prompt2)

# Ask the model the questions
second_chat <- chat(
  openai.API = key, # defined in Example 1
  model = model, # defined in Example 1
  prompts = prompts, # NEW
  system.role = system.role, # defined in Example 1
  reps = reps # defined in Example 1
)

# The outputted data frame for this example will have 6 rows
# since the number of prompts (2) times the number of reps (3)
# gives a total of 6 API calls.
second_chat$response[second_chat$prompt==prompt1] # the responses from prompt 1
second_chat$response[second_chat$prompt==prompt2] # the responses from prompt 2

######################################################################
### Example 3: Send multiple prompts with different System Roles ###
######################################################################

# Perhaps your prompts are not related. In that case, you would probably want
# to set a different system role for each prompt.
# Let's change `prompt 2` to be entirely unrelated to astronomy.
prompt2 <- "What is the difference between eukaryotes and prokaryotes? Why?"

# This new second prompt does not fit with the astronomy tutor persona. Let's
# write a persona to match this new prompt topic.
system.role2 <- "You specialize in tutoring biology for middle school students."

# Now, let's combine the system roles into a single object
system.role <- c(system.role, # defined in Example 1: the astronomy tutor
                 system.role2 # defined above: the biology tutor
                 )

# Aggregate our prompts in a single object again
prompts <- c(prompt1, # Asks about Saturn's rings (needs astronomy tutor)
             prompt2 # Asks about types of cells (needs biology tutor)
             )

# Ask the model the questions
third_chat <- chat(
  openai.API = key, # defined in Example 1
  model = model, # defined in Example 1
```

```
  prompts = prompts, # NEW
  system.role = system.role, # NEW
  reps = reps # defined in Example 1
)

# View the outputted data frame to examine the responses
View(third_chat)

## End(Not run)
```

`check_for_default_APIs` *Check for users who pasted the example code but didn't add an API key*

Description

Check for users who pasted the example code but didn't add an API key

Usage

```
check_for_default_APIs(
  hf.token,
  groq.API = NULL,
  openai.API,
  anthropic.API = NULL,
  jina.API = NULL
)
```

Arguments

`hf.token`	The hugging face token provided
`groq.API`	The Groq API key provided
`openai.API`	The OpenAI API key provided
`anthropic.API`	Character. Anthropic API key. Can be NULL when Anthropic models are not used.
`jina.API`	Character. Jina AI API key. Can be NULL when Jina embeddings are not used.

check_local_llm_setup *Check Local LLM Setup*

Description

Verifies that all requirements for local LLM inference are met, including Python environment, llama-cpp-python installation, and model file accessibility.

Usage

```
check_local_llm_setup(model.path, silently = FALSE)
```

Arguments

model.path	Path to the GGUF model file
silently	Logical. Suppress progress messages?

Value

Logical. TRUE if setup is complete, FALSE otherwise.

embeddings.gpt5.4.example *GPT-5.4 Example Item Embeddings*

Description

A numeric embedding matrix corresponding to items.gpt5.4.example, provided for demonstrating GENIE without requiring an external embedding API call.

Usage

```
data("embeddings.gpt5.4.example")
```

Format

A 1536 x 180 numeric matrix. Rows are embedding dimensions and columns are items. Column names correspond to the item IDs in items.gpt5.4.example.

Details

The embeddings were generated from the GPT-5.4 example item pool using OpenAI's text-embedding-3-small embedding model. The matrix is oriented in the format expected by GENIE: embedding dimensions in rows and items in columns.

The corresponding item metadata are available as items.gpt5.4.example.

See Also

items.gpt5.4.example, GENIE

Examples

```
data("embeddings.gpt5.4.example")

dim(embeddings.gpt5.4.example)

data("items.gpt5.4.example")
all(
  colnames(embeddings.gpt5.4.example) %in%
    as.character(items.gpt5.4.example$ID)
)
```

`embedding_matrix_validate_GENIE`

Validate Embedding Matrix for GENIE

Description

Validates that the optional embedding matrix meets all requirements for GENIE processing. Ensures proper structure, dimensions, column names match item IDs, and numeric content.

Usage

```
embedding_matrix_validate_GENIE(embedding.matrix, items, silently = FALSE)
```

Arguments

`embedding.matrix`	A numeric matrix or data frame with rows as embedding dimensions and columns as items. Can be NULL if embeddings will be generated.
`items`	A validated items data frame (already processed by items_validate_GENIE)
`silently`	Logical. If FALSE, displays informational messages

Value

A validated embedding matrix (always as matrix type) or NULL if not provided

ensure_aigenie_python *Ensure AI-GENIE Python Environment is Ready*

Description

Sets up the Python environment with all required dependencies for AI-GENIE. Uses UV for fast, reliable package management. This function is called automatically when needed, but can also be called directly.

Usage

```
ensure_aigenie_python(
  force_reinstall = FALSE,
  include_huggingface = TRUE,
  include_local_llm = FALSE,
  gpu = FALSE
)
```

Arguments

force_reinstall	Logical. Force complete reinstallation?
include_huggingface	Logical. Include HuggingFace packages? Default TRUE.
include_local_llm	Logical. Include local LLM support? Default FALSE.
gpu	Logical. Install GPU-enabled PyTorch? Default FALSE.

Value

TRUE invisibly on success

final_community_detection *Run Final Community Detection with EGA*

Description

Run Final Community Detection with EGA

Usage

```
final_community_detection(
  embedding_matrix,
  true_communities,
  model = "glasso",
  algorithm = "walktrap",
  uni.method = "louvain",
  corr = "auto"
)
```

Arguments

embedding_matrix	A numeric matrix with items as columns.
true_communities	Named list mapping items to known communities.
model	Network estimation model (e.g., "glasso", "TMFG").
algorithm	Community detection algorithm (e.g., "walktrap").
uni.method	Unidimensionality method passed to EGA.
corr	Character. Correlation method. Default "auto" uses EGAnet's automatic detection.

Value

A list with final communities, final NMI, dropped items, EGA object, and success flag.

GENIE *The use of the psychometric reduction component of AIGENIE on your pre-existing item pool*

Description

GENIE applies the psychometric reduction steps present in AIGENIE on user-supplied items. Users provide their own items and optionally their own embeddings, then GENIE performs redundancy reduction and structural validation to assess item quality and dimensionality.

Usage

```
GENIE(
  items,
  embedding.matrix = NULL,
  openai.API = NULL,
  hf.token = NULL,
  jina.API = NULL,
  embedding.model = "text-embedding-3-small",
  EGA.model = NULL,
```

```
  EGA.algorithm = NULL,
  EGA.uni.method = NULL,
  uva.cut.off = 0.2,
  boot.iter = 500,
  ncores = NULL,
  embeddings.only = FALSE,
  run.overall = FALSE,
  all.together = FALSE,
  plot = TRUE,
  silently = FALSE
)
```

Arguments

`items`	Data frame with columns: statement, attribute, type, ID. All columns must be character type except ID (numeric or character allowed). • `statement`: The actual item text • `attribute`: The construct/attribute the item measures • `type`: The item type/category • `ID`: Unique identifier for each item
`embedding.matrix`	Optional numeric matrix or data frame where: • Rows represent embedding dimensions • Columns represent items (must match items$ID exactly) • If `NULL`, embeddings will be generated using `embedding.model`
`openai.API`	OpenAI API key (required if using OpenAI embedding models)
`hf.token`	HuggingFace token (optional, improves rate limits for HF models)
`jina.API`	Jina AI API key for using Jina embedding models (e.g., "jina-embeddings-v3"). Free tier available at https://jina.ai/.
`embedding.model`	Embedding model to use if embedding.matrix not provided: • OpenAI: "text-embedding-3-small", "text-embedding-3-large", "text-embedding-ada-002" • Jina AI: "jina-embeddings-v3", "jina-embeddings-v4", "jina-embeddings-v2-base-en" (requires jina.API) • HuggingFace: "BAAI/bge-base-en-v1.5", "BAAI/bge-small-en-v1.5", "sentence-transformers/all-MiniLM-L6-v2"
`EGA.model`	EGA network estimation model ("glasso", "TMFG", or NULL for auto-selection)
`EGA.algorithm`	EGA community detection algorithm ("walktrap", "leiden", "louvain")
`EGA.uni.method`	Unidimensionality assessment method ("louvain", "expand", "LE")
`uva.cut.off`	Numeric in `[0, 1)`. wTO threshold passed to `EGAnet::UVA` for the redundancy-reduction step (default: 0.20). Lower values remove more items.
`boot.iter`	A positive integer (optional, default: 500). Number of bootstrap iterations used by `EGAnet::bootEGA` during item-stability analyses and iterative stability filtering.

ncores — A positive integer or NULL (optional, default: NULL). Number of processing cores passed to EGAnet::bootEGA. When NULL, AIGENIE does not pass an ncores argument, preserving the current default behavior of EGAnet::bootEGA.

embeddings.only — If TRUE, return embeddings and stop (skip network analysis)

run.overall — A logical value (optional, default: FALSE). Controls whether a *fit* analysis on the complete item pool is run *post-reduction.* By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is TRUE, an additional analysis is run on the overall sample, but no further reductions at the overall level are made. If only one item type is present, this argument will be ignored.

all.together — A logical value (optional, default: FALSE). Controls whether the *reduction* analysis on the complete item pool is run. By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is TRUE, reductions are made at the overall level (i.e., all items go through the reduction pipeline together, agnostic of item type). If only one item type is present, this argument will be ignored.

plot — If TRUE, display network comparison plots

silently — If TRUE, suppress progress messages

model — Language model identifier (currently unused in GENIE)

Value

The structure of the return value depends on the function flags.

Defaults: items.only = FALSE, embeddings.only = FALSE, run.overall = FALSE, all.together = FALSE.

When items.only = TRUE**:** Returns a data.frame of generated items with columns: ID, statement, type, and attribute.

When embeddings.only = TRUE**:** Returns a named list with two elements:

- embeddings — an embedding matrix/list (columns or rownames correspond to item IDs).
- items — the items data.frame described above.

Default behaviour (items.only = FALSE, embeddings.only = FALSE, run.overall = FALSE, all.together = FALSE): Returns a named list with two top-level elements:

item_type_level — A named list where each name is an item type and each element is a per-type named list containing:

- final_NMI — Numeric: final normalized mutual information after reduction.
- initial_NMI — Numeric: initial NMI of the pre-reduced item pool.
- embeddings — List or matrix of embeddings for this item type (see 'Notes on embeddings' below).
- UVA — List from Unique Variable Analysis (contains at least n_removed, n_sweeps, redundant_pairs data.frame).
- bootEGA — List with bootEGA results (e.g. initial_boot, final_boot, n_removed, items_removed, initial_boot_with_redundancies).

`EGA.model_selected` Character: chosen EGA model (e.g. `"TMFG"` or `"Glasso"`).

`final_items` `data.frame`: final items after reduction (columns include `ID`, `statement`, `attribute`, `type`, `EGA_com`).

`final_EGA` EGA object (from EGAnet) after reduction.

`initial_EGA` Initial EGA object computed on the pre-reduced item set.

`start_N` Integer: initial number of items in this type.

`final_N` Integer: final number of items in this type.

`network_plot` `ggplot` / `patchwork` object comparing networks before vs after reduction.

`stability_plot` `ggplot` / `patchwork` object showing item stability before vs after reduction.

`overall` Named list with aggregated results across all item types. Under the default this contains:

`final_items` `data.frame` of final items across all types (columns as above).

`embeddings` Embeddings for the full reduced item set (see 'Notes on `embeddings`' below). Note: `overall$embeddings` does **not** include `selected`.

When `run.overall` = `TRUE` (`items.only` = `FALSE`, `embeddings.only` = `FALSE`):

`item_type_level` Same per-type structure as the default (see above).

`overall` A named list with aggregated results (not limited to `final_items` and `embeddings`) containing: `final_NMI`, `initial_NMI`, `embeddings`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, and `network_plot`.

When `all.together` = `TRUE` (regardless of `run.overall`): Results are **not** split into `item_type_level` and `overall`. Instead the function returns a single named list containing: `final_NMI`, `initial_NMI`, `embeddings`, `UVA`, `bootEGA`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, `network_plot`, and `stability_plot`.

## End(Not run)
```

get_local_llm *Download a Local LLM Model*

Description

Downloads a GGUF model from HuggingFace for use with local_AIGENIE. Models are saved to a user-specified directory or the default AIGENIE models directory.

Usage

```
get_local_llm(repo_id, filename, save_dir = NULL, hf.token = NULL)
```

Arguments

repo_id	HuggingFace repository ID (e.g., "TheBloke/Mistral-7B-Instruct-v0.2-GGUF")
filename	Specific GGUF filename to download (e.g., "mistral-7b-instruct-v0.2.Q4_K_M.gguf")
save_dir	Directory to save the model. If NULL, uses the default AIGENIE models directory.
hf.token	Optional HuggingFace token for gated models

Value

Character string with the full path to the downloaded model file.

Examples

```
## Not run:
# Download a Mistral 7B model
model_path <- get_local_llm(
  repo_id = "TheBloke/Mistral-7B-Instruct-v0.2-GGUF",
  filename = "mistral-7b-instruct-v0.2.Q4_K_M.gguf"
)

# Use it with local_AIGENIE
results <- local_AIGENIE(
  item.attributes = my_attributes,
  model.path = model_path
)

## End(Not run)
```

`install_gpu_support` *Install GPU Support for AI-GENIE*

Description

Reinstalls the Python environment with GPU-enabled PyTorch for faster inference with local embedding models. Requires a CUDA-compatible NVIDIA GPU and proper driver installation.

Usage

```
install_gpu_support()
```

Details

This function:

1. Removes the existing Python environment
2. Creates a new environment with GPU-enabled PyTorch
3. Installs all HuggingFace dependencies

On Apple Silicon Macs, MPS (Metal Performance Shaders) acceleration is used automatically without needing this function.

Value

Invisible `TRUE` on success.

See Also

`reinstall_python_env`, `python_env_info`.

Examples

```
## Not run:
# Enable GPU acceleration (requires NVIDIA GPU + CUDA)
install_gpu_support()

## End(Not run)
```

install_local_llm_support *Install Local LLM Support*

Description

Installs llama-cpp-python for running local GGUF models with local_AIGENIE. On Apple Silicon Macs, this includes Metal acceleration support for fast inference.

Usage

```
install_local_llm_support()
```

Details

After installation, you can use any GGUF model file with local_AIGENIE(). Download GGUF models from HuggingFace (search for "GGUF" format).

Popular model recommendations:

- **Llama 3 8B**: Good balance of quality and speed
- **Mistral 7B**: Fast with good quality
- **Qwen 2.5**: Strong multilingual support

Value

Invisible TRUE on success.

See Also

local_AIGENIE, reinstall_python_env.

Examples

```
## Not run:
# Install local LLM support
install_local_llm_support()

# Then download a GGUF model and use with local_AIGENIE
results <- local_AIGENIE(
  item.attributes = my_traits,
  model.path = "~/models/llama-3-8b.Q4_K_M.gguf",
  embedding.model = "bert-base-uncased"
)

## End(Not run)
```

item.examples_validate

Validate and Clean `item.examples` *Against Cleaned* `items.attributes`

Description

Ensures `item.examples` is a data frame with required string columns and that the values in `type` and `attribute` align with the cleaned structure of `items.attributes`. Returns a cleaned version of the data frame with normalized values:

- `type` and `attribute` are trimmed and lowercased
- `statement` is trimmed (case preserved)

Usage

```
item.examples_validate(item.examples, items.attributes)
```

Arguments

`item.examples`	A data frame with columns `type`, `attribute`, `statement`. All values must be non-empty strings.
`items.attributes`	A cleaned list from `validate_items.attributes()`. All names and values must be normalized (lowercased and trimmed).

Value

A cleaned version of `item.examples` with normalized values.

item.type.definitions_validate

Validate and Clean `item.type.definitions`

Description

Validates that `item.type.definitions` is a named list where:

- Names are unique (after trim + case-fold)
- Names exist in `items.attributes`
- Values are non-empty strings

Usage

```
item.type.definitions_validate(item.type.definitions, items.attributes)
```

Arguments

`item.type.definitions`
: A named list of strings, where each name must correspond to a name in `items.attributes` and each value must be a non-empty string.

`items.attributes`
: A cleaned list from `validate_items.attributes()`.

Details

Returns a cleaned version with:

- Normalized names (trimmed and lowercased)
- Trimmed values (case preserved)

Value

A cleaned version of `item.type.definitions`.

`items.attributes_validate` *Validate* `items.attributes`

Description

Validates that `items.attributes` is a **named list** whose names are truly unique after trimming whitespace and ignoring case, and that each element is itself a list **containing only strings**, with **at least two** truly unique strings (same trimming + case-insensitive rule).

Usage

```
items.attributes_validate(items.attributes)
```

Arguments

`items.attributes`
: A named list. Each element must be a list containing only character scalars (strings). Each of those inner lists must contain at least two truly unique strings after trimming and case-folding.

Value

A cleaned version of `items.attributes` with normalized names and values. Errors are thrown if validation fails.

`items.gpt5.4.example` *GPT-5.4 Example Item Pool*

Description

An example item pool generated with GPT-5.4 for demonstrating the psychometric reduction workflow implemented in GENIE. The data contain 180 personality items: 90 conscientiousness items and 90 openness items.

Usage

```
data("items.gpt5.4.example")
```

Format

A data frame with 180 rows and 4 variables:

`ID` Unique item identifier.

`statement` The generated item statement.

`type` Higher-order item type: conscientiousness or openness.

`attribute` Target attribute represented by the item.

Details

The item pool is the GPT-5.4 example used to illustrate AI-GENIE/GENIE item reduction. Conscientiousness items represent self-efficacy, achievement-striving, and perseverance. Openness items represent introspection, aesthetics, and abstract-thinking.

The corresponding embedding matrix is available as `embeddings.gpt5.4.example`.

See Also

`embeddings.gpt5.4.example`, `GENIE`

Examples

```
data("items.gpt5.4.example")

dim(items.gpt5.4.example)
head(items.gpt5.4.example)
table(items.gpt5.4.example$type)
table(items.gpt5.4.example$attribute)
```

items_validate_GENIE *Validate Items Data Frame for GENIE*

Description

Validates that the items data frame meets all requirements for GENIE processing. Ensures proper structure, column presence, data types, and content validity.

Usage

```
items_validate_GENIE(items)
```

Arguments

items	A data frame that should contain columns: statement, attribute, type, ID

Value

A cleaned and validated items data frame with standardized formatting

iterative_stability_check *Iteratively run BootEGA to ensure structural stability of items*

Description

Iteratively run BootEGA to ensure structural stability of items

Usage

```
iterative_stability_check(
  embedding_matrix,
  items,
  cut.off = 0.75,
  model = "NULL",
  algorithm = "",
  uni.method,
  corr = "auto",
  ncores = NULL,
  boot.iter = 500,
  EGA.type = "EGA.fit",
  silently
)
```

Arguments

`embedding_matrix`	Numeric matrix of item embeddings (columns = items).
`items`	Data frame containing at least `ID` and `statement`.
`cut.off`	Numeric. Minimum stability required to retain an item.
`model`	Network estimation model (e.g., "glasso", "TMFG").
`algorithm`	Community detection algorithm.
`uni.method`	Unidimensionality method.
`corr`	Character. Correlation method. Default "auto" uses EGAnet's automatic detection.
`ncores`	Numeric. Number of cores for parallel processing. Default NULL uses EGAnet default.
`boot.iter`	Numeric. Number of bootstrap iterations. Default 500.
`EGA.type`	Type of EGA (default "EGA.fit").
`silently`	Logical. Suppress output.

Value

A list containing the final embedding, initial/final bootEGA objects, and an `items_removed` data frame. For each removed item, the table retains the bootstrap run, empirical item stability, cutoff, stability deficit, and removal reason. Zero-removal runs return an empty data frame, not `NULL`.

`list_available_models` *List Available Models*

Description

Queries the OpenAI, Groq, Anthropic, and/or Jina AI APIs to retrieve currently available models. Requires API keys for live provider queries. Jina AI models are returned from a curated static list (no list endpoint).

Usage

```
list_available_models(
  provider = NULL,
  openai.API = NULL,
  groq.API = NULL,
  anthropic.API = NULL,
  type = NULL
)
```

Arguments

provider	Optional. Filter by provider: "openai", "groq", "anthropic", "jina", or NULL for all.
openai.API	Optional OpenAI API key. If NULL, checks OPENAI_API_KEY env var.
groq.API	Optional Groq API key. If NULL, checks GROQ_API_KEY env var.
anthropic.API	Optional Anthropic API key. If NULL, checks ANTHROPIC_API_KEY env var.
type	Filter by model type: "chat", "embedding", or NULL for all. Default is NULL (show everything).

Value

A data frame with columns: provider, model, type, display_name, created

---

local_AIGENIE *Generate and Validate Psychometric Scale Items Using Local Models*

Description

Local version of AI-GENIE that uses locally installed language models and embeddings for complete privacy and offline operation. Generates items, creates embeddings, and performs network psychometric reduction entirely on the user's machine.

Usage

```
local_AIGENIE(
  item.attributes,
  model.path,
  embedding.model = "bert-base-uncased",
  main.prompts = NULL,
  temperature = 1,
  top.p = 1,
  target.N = NULL,
  domain = NULL,
  scale.title = NULL,
  item.examples = NULL,
  audience = NULL,
  item.type.definitions = NULL,
  response.options = NULL,
  prompt.notes = NULL,
  system.role = NULL,
  EGA.model = NULL,
  EGA.algorithm = NULL,
  EGA.uni.method = NULL,
  uva.cut.off = 0.2,
```

```
  boot.iter = 500,
  ncores = NULL,
  n.ctx = 4096,
  n.gpu.layers = -1,
  max.tokens = 1024,
  device = "auto",
  batch.size = 32,
  pooling.strategy = "mean",
  max.length = 512L,
  keep.org = FALSE,
  items.only = FALSE,
  embeddings.only = FALSE,
  adaptive = TRUE,
  run.overall = FALSE,
  all.together = FALSE,
  plot = TRUE,
  silently = FALSE
)
```

Arguments

item.attributes	Named list of item types and their attributes (required)
model.path	Path to local GGUF model file (required)
embedding.model	Name or path to local embedding model (default: "bert-base-uncased")
main.prompts	Custom prompts for item generation (optional)
temperature	LLM temperature for randomness (0-2, default: 1)
top.p	Top-p nucleus sampling parameter (0-1, default: 1)
target.N	Number of items to generate per type (default: 60)
domain	Content domain (e.g., "psychological")
scale.title	Name of the scale
item.examples	Data frame of example items
audience	Target population
item.type.definitions	Definitions for item types
response.options	Response scale labels
prompt.notes	Additional instructions for generation
system.role	Custom system prompt
EGA.model	Network model ("glasso", "TMFG", or NULL for auto)
EGA.algorithm	Community detection algorithm (default: "walktrap" when there is one trait and "louvain" when there are multiple)
EGA.uni.method	Unidimensionality method (default: "louvain")

uva.cut.off	Numeric in [0, 1). wTO threshold passed to EGAnet::UVA for the redundancy-reduction step (default: 0.20). Lower values remove more items.
boot.iter	A positive integer (optional, default: 500). Number of bootstrap iterations used by EGAnet::bootEGA during item-stability analyses and iterative stability filtering.
ncores	A positive integer or NULL (optional, default: NULL). Number of processing cores passed to EGAnet::bootEGA. When NULL, AIGENIE does not pass an ncores argument, preserving the current default behavior of EGAnet::bootEGA.
n.ctx	Context window size (default: 4096)
n.gpu.layers	GPU layers to use (-1 for all, default: -1)
max.tokens	Maximum tokens per generation (default: 1024)
device	Device for embeddings ("auto", "cpu", "cuda", "mps")
batch.size	Batch size for embeddings (default: 32)
pooling.strategy	Pooling for embeddings ("mean", "cls", "max")
max.length	Max sequence length for embeddings (default: 512)
keep.org	Keep original items and embeddings (default: FALSE)
items.only	Generate items only, skip reduction (default: FALSE)
embeddings.only	Generate embeddings only (default: FALSE)
adaptive	Use adaptive generation (default: TRUE)
run.overall	A logical value (optional, default: FALSE). Controls whether a *fit* analysis on the complete item pool is run *post-reduction.* By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is TRUE, an additional analysis is run on the overall sample, but no further reductions at the overall level are made. If only one item type is present, this argument will be ignored.
all.together	A logical value (optional, default: FALSE). Controls whether the *reduction* analysis on the complete item pool is run. By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is TRUE, reductions are made at the overall level (i.e., all items go through the reduction pipeline together, agnostic of item type). If only one item type is present, this argument will be ignored.
plot	Display network plots (default: TRUE)
silently	Suppress progress messages (default: FALSE)

Value

The structure of the return value depends on the function flags.

Defaults: items.only = FALSE, embeddings.only = FALSE, run.overall = FALSE, keep.org = FALSE, all.together = FALSE.

When items.only = TRUE**:** Returns a data.frame of generated items with columns: ID, statement, type, and attribute.

When embeddings.only = TRUE**:** Returns a named list with two elements:

- embeddings — an embedding matrix/list (columns or rownames correspond to item IDs).
- items — the items data.frame described above.

Default behaviour (items.only = FALSE, embeddings.only = FALSE, run.overall = FALSE, keep.org = FALSE, all.together = FALSE): Returns a named list with two top-level elements:

item_type_level A named list where each name is an item type and each element is a per-type named list containing:

final_NMI Numeric: final normalized mutual information after reduction.

initial_NMI Numeric: initial NMI of the pre-reduced item pool.

embeddings List or matrix of embeddings for this item type (see 'Notes on embeddings' below).

UVA List from Unique Variable Analysis (contains at least n_removed, n_sweeps, redundant_pairs data.frame).

bootEGA List with bootEGA results (e.g. initial_boot, final_boot, n_removed, items_removed, initial_boot_with_redundancies).

EGA.model_selected Character: chosen EGA model (e.g. "TMFG" or "Glasso").

final_items data.frame: final items after reduction (columns include ID, statement, attribute, type, EGA_com).

final_EGA EGA object (from EGAnet) after reduction.

initial_EGA Initial EGA object computed on the pre-reduced item set.

start_N Integer: initial number of items in this type.

final_N Integer: final number of items in this type.

network_plot ggplot / patchwork object comparing networks before vs after reduction.

stability_plot ggplot / patchwork object showing item stability before vs after reduction.

overall Named list with aggregated results across all item types. Under the default this contains:

final_items data.frame of final items across all types (columns as above).

embeddings Embeddings for the full reduced item set (see 'Notes on embeddings' below). Note: overall$embeddings does **not** include selected.

When keep.org = TRUE (in addition to defaults above): The top-level shape remains (item_type_level and overall) but includes original (pre-reduction) information:

item_type_level Each per-type sublist contains: final_NMI, initial_NMI, embeddings, UVA, bootEGA, EGA.model_selected, final_items, initial_items, final_EGA, initial_EGA, start_N, final_N, network_plot, stability_plot.

overall Contains final_items, initial_items, and embeddings for the full item pool.

For keep.org = TRUE, per-type embeddings contains at least: full_org, sparse_org, selected, full, and sparse. (overall$embeddings contains the same subcomponents **except** selected is omitted.)

When run.overall = TRUE (items.only = FALSE, embeddings.only = FALSE):

item_type_level Same per-type structure as the default (see above).

overall A named list with aggregated results (not limited to final_items and embeddings) containing: final_NMI, initial_NMI, embeddings, EGA.model_selected, final_items, final_EGA, initial_EGA, start_N, final_N, and network_plot.

When `all.together = TRUE` (regardless of `run.overall`): Results are **not** split into `item_type_level` and `overall`. Instead the function returns a single named list (applies to the full — possibly `keep.org` modified — result set) containing: `final_NMI`, `initial_NMI`, `embeddings`, `UVA`, `bootEGA`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, `network_plot`, and `stability_plot`.

## End(Not run)
```

`local_chat` *Chat with a local LLM (no API calls)*

Description

Send one or more prompts to a locally available large-language model (LLM) without making remote API calls. The local model must be installed/available on the machine as a local model directory. This function is intended for fully local inference (no API key required).

Usage

```
local_chat(
  prompts,
  model.path,
  n.ctx = 4096,
  n.gpu.layers = -1,
  max.tokens = 1024,
  system.role = NULL,
  reps = 1,
  temperature = 1,
  top.p = 1,
  silently = FALSE
)
```

Arguments

prompts	A character string or character vector. The main prompt(s) given to the model. If multiple prompts are supplied, each will be sent separately to the model.
model.path	A character string. Path for the local model file. The function does not download models; ensure the model is present locally before using this function.
n.ctx	Integer, default 4096. The context window (number of tokens) available to the model for a single generation.
n.gpu.layers	Integer, default -1. Number of model layers to place on GPU (if supported). Use -1 to let the runtime choose automatically.
max.tokens	Integer, default 1024L. Maximum number of tokens requested from the local model for a single generation.
system.role	A character string or character vector, default NULL. The system role(s) (model persona). If only one system role is provided and multiple prompts are supplied, the same role will be used for each prompt. If multiple system roles are provided, they should align with the prompts.
reps	Integer, default 1. The number of times each prompt will be given to the model (independent generations).
temperature	Numeric, default 1. Sampling temperature controlling response randomness.
top.p	Numeric, default 1. Top-p (nucleus) sampling parameter.
silently	Logical, default FALSE. If FALSE, progress messages are printed to the console. If TRUE, the function runs quietly.

Details

Before running this function check that you are able to run the local environment via check_local_llm_setup().

For each prompt × repetition the function constructs a full_prompt that includes the system.role and the user prompt, sets a deterministic generation seed per generation, and calls the local model. A retry loop (up to 5 attempts, with brief waits) handles transient failures; if all attempts fail the function aborts with an informative error.

Value

A data.frame with one row per generation (i.e., per prompt × repetition) containing:

- rep — repetition index
- prompt — the prompt text sent to the model
- response — the raw text response returned by the model

Important / Warnings

- Local model inference can be resource intensive. Large models may require substantial disk space, RAM, and (optionally) GPU support. Performance and feasibility depend on model size and hardware.
- model.path must point to a model already present; this function will not download remote models.

Examples

```
## Not run:
################################################
### Example 1: Writing a Very Basic Prompt  #####
################################################

# For local_chat you do NOT need an API key, but you DO need a text generation
# model available locally.
model <- "path/to/local-model" # replace with your local model path

# Then, write your prompt. This will be given to the model directly.
prompt <- "Why does the planet Saturn have rings? Give a 100 word explanation."

# Optionally, add a system role (a model persona)
system.role <- "You specialize in tutoring astronomy for high school students."

# Add the number of prompt repetitions. By default, this is set to 1. But it
# may be useful to increase the number of repetitions to get a sense of how
# consistent your output might be.
reps <- 3

# Now you are ready to chat with the local model
first_chat <- local_chat(
  model.path = model, # local model identifier or path
  prompts = prompt,
  system.role = system.role,
  reps = reps
)

# Check how the output changes from iteration to iteration
first_chat$response[[1]] # first iteration output
first_chat$response[[2]] # second iteration output
first_chat$response[[3]] # third iteration output

#####################################################################
### Example 2: Send multiple prompts in a single function call #####
#####################################################################

# You are able to send more than one prompt in a single call
prompt1 <- "Why does the planet Saturn have rings? Give a 100 word explanation."
prompt2 <- "Which planet is the hottest in our solar system? How do we know?"

# Aggregate the prompts in a single object
prompts <- c(prompt1, prompt2)

# Ask the model the questions
second_chat <- local_chat(
```

```
  model.path = model, # defined above
  prompts = prompts, # NEW
  system.role = system.role, # defined above
  reps = reps # defined above
)

# The outputted data frame for this example will have 6 rows
# since the number of prompts (2) times the number of reps (3)
# gives a total of 6 generations.
second_chat$response[second_chat$prompt == prompt1] # the responses from prompt 1
second_chat$response[second_chat$prompt == prompt2] # the responses from prompt 2

######################################################################
### Example 3: Send multiple prompts with different System Roles ###
######################################################################

# Perhaps your prompts are not related. In that case, you would probably want
# to set a different system role for each prompt.
prompt2 <- "What is the difference between eukaryotes and prokaryotes? Why?"

# This new second prompt does not fit with the astronomy tutor persona. Let's
# write a persona to match this new prompt topic.
system.role2 <- "You specialize in tutoring biology for middle school students."

# Now, let's combine the system roles into a single object
system.role <- c(system.role, # defined earlier: the astronomy tutor
                 system.role2 # defined above: the biology tutor
                 )

# Aggregate our prompts in a single object again
prompts <- c(prompt1, # Asks about Saturn's rings (needs astronomy tutor)
             prompt2 # Asks about types of cells (needs biology tutor)
             )

# Ask the model the questions
third_chat <- local_chat(
  model.path = model,
  prompts = prompts,
  system.role = system.role,
  reps = reps
)

# View the outputted data frame to examine the responses
View(third_chat)

## End(Not run)
```

---

local_GENIE *Local Generative Network-Integrated Evaluation (local_GENIE)*

Description

Local version of GENIE that uses locally installed embedding models for complete privacy and offline operation. Provides the same psychometric validation and quality assessment for user-supplied items as GENIE, but generates embeddings locally using transformer models instead of API calls.

Usage

```
local_GENIE(
  items,
  embedding.matrix = NULL,
  embedding.model = "bert-base-uncased",
  device = "auto",
  batch.size = 32,
  pooling.strategy = "mean",
  max.length = 512,
  EGA.model = NULL,
  EGA.algorithm = NULL,
  EGA.uni.method = NULL,
  uva.cut.off = 0.2,
  boot.iter = 500,
  ncores = NULL,
  embeddings.only = FALSE,
  run.overall = FALSE,
  all.together = FALSE,
  plot = TRUE,
  silently = FALSE
)
```

Arguments

`items` Data frame with columns: statement, attribute, type, ID. All columns must be character type except ID (numeric or character allowed).

- `statement`: The actual item text
- `attribute`: The construct/attribute the item measures
- `type`: The item type/category
- `ID`: Unique identifier for each item

`embedding.matrix` Optional numeric matrix or data frame where:

- Rows represent embedding dimensions
- Columns represent items (must match items$ID exactly)
- If `NULL`, embeddings will be generated using `embedding.model`

`embedding.model` Local embedding model identifier or path. Compatible models:

- BERT variants: "bert-base-uncased", "bert-large-uncased"
- RoBERTa: "roberta-base", "roberta-large"
- DeBERTa: "microsoft/deberta-v3-base", "microsoft/deberta-v3-large"

- DistilBERT: "distilbert-base-uncased"
- Local paths: e.g., "/path/to/local/model"

`device` Device for embedding computation:

- "auto": Automatically detect best available device
- "cpu": Force CPU usage
- "cuda": Use NVIDIA GPU (if available)
- "mps": Use Apple Silicon GPU (if available)

`batch.size` Number of items to process simultaneously (default: 32)

`pooling.strategy`
Method for pooling token embeddings:

- "mean": Average all token embeddings (default)
- "cls": Use only the CLS token embedding
- "max": Max pooling across tokens

`max.length` Maximum sequence length for tokenization (default: 512)

`EGA.model` Network estimation model ("glasso", "TMFG", or NULL for auto-selection)

`EGA.algorithm` Community detection algorithm ("walktrap", "leiden", "louvain")

`EGA.uni.method` Unidimensionality assessment method ("louvain", "expand", "LE")

`uva.cut.off` Numeric in `[0, 1)`. wTO threshold passed to `EGAnet::UVA` for the redundancy-reduction step (default: 0.20). Lower values remove more items.

`boot.iter` A positive integer (optional, default: 500). Number of bootstrap iterations used by `EGAnet::bootEGA` during item-stability analyses and iterative stability filtering.

`ncores` A positive integer or `NULL` (optional, default: `NULL`). Number of processing cores passed to `EGAnet::bootEGA`. When `NULL`, AIGENIE does not pass an `ncores` argument, preserving the current default behavior of `EGAnet::bootEGA`.

`embeddings.only`
If `TRUE`, return embeddings and stop (skip network analysis)

`run.overall` A logical value (optional, default: FALSE). Controls whether a *fit* analysis on the complete item pool is run *post-reduction.* By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is `TRUE`, an additional analysis is run on the overall sample, but no further reductions at the overall level are made. If only one item type is present, this argument will be ignored.

`all.together` A logical value (optional, default: FALSE). Controls whether the *reduction* analysis on the complete item pool is run. By default, only type-level reduction analyses are run (i.e., items of like-type go through the pipeline independent of the other items in the pool). When this flag is `TRUE`, reductions are made at the overall level (i.e., all items go through the reduction pipeline together, agnostic of item type). If only one item type is present, this argument will be ignored.

`plot` If `TRUE`, display network comparison plots

`silently` If `TRUE`, suppress progress messages

Value

Defaults: `items.only` = `FALSE`, `embeddings.only` = `FALSE`, `run.overall` = `FALSE`, `all.together` = `FALSE`.

When `items.only` = `TRUE`**:** Returns a `data.frame` of generated items with columns: `ID`, `statement`, `type`, and `attribute`.

When `embeddings.only` = `TRUE`**:** Returns a named `list` with two elements:

- `embeddings` — an embedding matrix/list (columns or rownames correspond to item IDs).
- `items` — the items `data.frame` described above.

Default behaviour (`items.only` = `FALSE`, `embeddings.only` = `FALSE`, `run.overall` = `FALSE`, `all.together` = `FALSE`): Returns a named `list` with two top-level elements:

`item_type_level` A named list where each name is an item type and each element is a per-type named list containing:

- `final_NMI` Numeric: final normalized mutual information after reduction.
- `initial_NMI` Numeric: initial NMI of the pre-reduced item pool.
- `embeddings` List or matrix of embeddings for this item type (see 'Notes on `embeddings`' below).
- `UVA` List from Unique Variable Analysis (contains at least `n_removed`, `n_sweeps`, `redundant_pairs` data.frame).
- `bootEGA` List with bootEGA results (e.g. `initial_boot`, `final_boot`, `n_removed`, `items_removed`, `initial_boot_with_redundancies`).
- `EGA.model_selected` Character: chosen EGA model (e.g. `"TMFG"` or `"Glasso"`).
- `final_items` `data.frame`: final items after reduction (columns include `ID`, `statement`, `attribute`, `type`, `EGA_com`).
- `final_EGA` EGA object (from EGAnet) after reduction.
- `initial_EGA` Initial EGA object computed on the pre-reduced item set.
- `start_N` Integer: initial number of items in this type.
- `final_N` Integer: final number of items in this type.
- `network_plot` `ggplot` / `patchwork` object comparing networks before vs after reduction.
- `stability_plot` `ggplot` / `patchwork` object showing item stability before vs after reduction.

`overall` Named list with aggregated results across all item types. Under the default this contains:

- `final_items` `data.frame` of final items across all types (columns as above).
- `embeddings` Embeddings for the full reduced item set (see 'Notes on `embeddings`' below). Note: `overall$embeddings` does **not** include `selected`.

When `run.overall` = `TRUE` (`items.only` = `FALSE`, `embeddings.only` = `FALSE`):

`item_type_level` Same per-type structure as the default (see above).

`overall` A named list with aggregated results (not limited to `final_items` and `embeddings`) containing: `final_NMI`, `initial_NMI`, `embeddings`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, and `network_plot`.

When `all.together` = `TRUE` (regardless of `run.overall`): Results are **not** split into `item_type_level` and `overall`. Instead the function returns a single named list containing: `final_NMI`, `initial_NMI`, `embeddings`, `UVA`, `bootEGA`, `EGA.model_selected`, `final_items`, `final_EGA`, `initial_EGA`, `start_N`, `final_N`, `network_plot`, and `stability_plot`.

## End(Not run)
```

`main.prompts_validate` *Validate and Normalize* `main.prompts`

Description

Validates that `main.prompts` is a named list of non-empty strings, one for each attribute in `items.attributes`, matched by normalized name.

Usage

```
main.prompts_validate(main.prompts, items.attributes, silently)
```

Arguments

main.prompts	A named list of prompt strings, one per attribute.
items.attributes	A cleaned list from validate_items.attributes().
silently	A flag determining wheter a warning message should be printed

Value

A cleaned and ordered named list of trimmed prompt strings. Also returns the appropriate 'custom' flag (TRUE if custom ok, FALSE if not)

---

max.tokens_validate *Check that max.tokens is an integer*

Description

Check that max.tokens is an integer

Usage

```
## S3 method for class 'tokens_validate'
max(max.tokens, silently)
```

Arguments

max.tokens	The number of tokens requested for the text generator
silently	Whether to print the warning statements

Value

if valid, the max.tokens value as an integer object type

---

plot_comparison *Plot Comparisons*

Description

Generates a comparative plot of two network analysis results, typically representing the item network before and after AI-GENIE reduction. The plot includes provided captions, displays NMI values for each network, and incorporates a scale title to contextualize the comparison. The layout may be adjusted based on the ident parameter.

Usage

```
plot_comparison(p1, p2, caption1, caption2, nmi2, nmi1, title)
```

Arguments

p1	An object representing the first network analysis result (e.g., the initial EGA object before reduction).
p2	An object representing the second network analysis result (e.g., the final EGA object after reduction).
caption1	A character string to be used as a caption or title for the first network (e.g., "Before AI-GENIE Network").
caption2	A character string for the second network (e.g., "After AI-GENIE Network").
nmi2	A numeric value representing the NMI of the second network.
nmi1	A numeric value representing the Normalized Mutual Information (NMI) of the first network.
title	A character string specifying the title of the plot.

Value

A plot object that visually compares the two network structures. The plot will typically display the two networks (either side-by-side or in an overlaid manner) with the provided captions and NMI values. The exact type of the plot object (e.g., a ggplot object or a base R plot) depends on the implementation.

---

plot_stability_comparison

Plot Stability Comparison (network + item stability dotplot, side by side)

Description

Builds a 4-panel comparison: pre-reduction network + pre-reduction item stability, next to post-reduction network + post-reduction item stability. Mirrors the layout of the AIGENIE simulation/reference figure.

Usage

```
plot_stability_comparison(boot1, boot2, caption1, caption2, nmi1, nmi2, title)
```

Arguments

boot1, boot2	bootEGA objects (pre and post reduction).
caption1, caption2	Captions under each network panel.
nmi1, nmi2	NMI values pre/post.
title	Overall title.

Value

A patchwork object combining the four panels.

print_results *Print Results*

Description

Displays a summary of the AI-GENIE analysis results, including the EGA model used, embedding type, starting and final number of items, and NMI values before and after reduction. The summary includes the number of iterations for both UVA (Unique Variable Analysis) and bootstrapped EGA steps.

Usage

```
print_results(obj, obj2, run.overall)
```

Arguments

obj	A list object containing the OVERALL analysis results returned by get_results.
obj2	A list object containing the ITEM-TYPE LEVEL analysis results returned by get_results.
run.overall	A flag denoting if overall results should be printed

Value

No return value; the function prints the results to the console.

python_env_info *Get AI-GENIE Python Environment Info*

Description

Returns diagnostic information about the AIGENIE Python environment, including paths, installation status, and installed packages. Useful for troubleshooting Python-related issues.

Usage

```
python_env_info()
```

Value

A list with the following elements:

env_path	Path to the virtual environment directory.
python_path	Path to the Python executable.
env_exists	Logical. Whether the environment directory exists.
python_exists	Logical. Whether the Python executable exists.

`initialized` Logical. Whether Python has been initialized this session.

`uv_available` Logical. Whether UV is installed and accessible.

`installed_packages`
Character vector of installed packages (if environment exists).

See Also

`reinstall_python_env` to fix environment issues.

Examples

```
## Not run:
# Check environment status
info <- python_env_info()

# Is the environment set up?
info$env_exists

# What packages are installed?
cat(info$installed_packages, sep = "\n")

# Is UV available?
info$uv_available

## End(Not run)
```

---

reduce_redundancy_uva *Reduce Redundancy via Iterative UVA (with Redundant Pair Logging)*

Description

Applies EGAnet::UVA iteratively and logs human-readable redundant item sets.

Usage

```
reduce_redundancy_uva(
  embedding_matrix,
  items,
  corr = "auto",
  uva.cut.off = 0.2
)
```

Arguments

`embedding_matrix`
A numeric matrix of embeddings (columns = items).

`items` Data frame with `ID` and `statement` columns.

corr — Character. Correlation method to use. Default "auto" uses EGAnet's automatic correlation detection. Other options: "pearson", "spearman", "cosine".

uva.cut.off — Numeric in [0, 1). The weighted topological overlap threshold passed to EGAnet::UVA. Items with pairwise wTO at or above this value are flagged as redundant. Default 0.20.

Value

A list with the reduced matrix, sweep metadata, human-readable redundancy groups, and removal_log, a tidy item-level table containing removed IDs, retained redundant partners, and wTO statistics.

---

reinstall_python_env *Reinstall AI-GENIE Python Environment*

Description

Removes and recreates the Python virtual environment with all required dependencies. Use this function if you encounter Python-related errors, want to update Python packages, or need to change the environment configuration.

AIGENIE uses UV (https://docs.astral.sh/uv/) for fast, reliable Python environment management.

Usage

```
reinstall_python_env(
  include_huggingface = TRUE,
  include_local_llm = FALSE,
  gpu = FALSE
)
```

Arguments

include_huggingface — Logical. Include HuggingFace packages (transformers, sentence-transformers, torch). Required for local embeddings with HuggingFace models. Default TRUE.

include_local_llm — Logical. Include llama-cpp-python for running local GGUF models with local_AIGENIE. Default FALSE.

gpu — Logical. Install GPU-enabled PyTorch. Requires CUDA-compatible NVIDIA GPU and proper driver installation. Default FALSE.

Value

Invisible TRUE on success.

See Also

python_env_info to check environment status, install_gpu_support for GPU setup, install_local_llm_support for local model setup.

Examples

```
## Not run:
# Fix Python environment issues
reinstall_python_env()

# Reinstall with GPU support
reinstall_python_env(gpu = TRUE)

# Minimal install (API-only, no HuggingFace - faster)
reinstall_python_env(include_huggingface = FALSE)

# Full install with local LLM support
reinstall_python_env(include_huggingface = TRUE, include_local_llm = TRUE)

## End(Not run)
```

---

resolve_model_name *Resolve and Normalize Model Name*

Description

Accepts a free-form model name and returns a standardized string. Known aliases are resolved to canonical model names. If the model is not recognized, a warning is issued and the cleaned original input is returned.

Usage

```
resolve_model_name(model, silently)
```

Arguments

model	A single string, the user-supplied model name.
silently	A flag to determine if warnings should be printed to the screen.

Value

A standardized model name.

response.options_validate

Validate and Clean `response.options`

Description

Validates that `response.options` is an atomic vector of non-empty strings, with no missing or invalid values. Whitespace is trimmed from each string.

Usage

```
response.options_validate(response.options)
```

Arguments

`response.options`	An atomic character vector of response labels.

run_flags_validate

Check that the `run.overall` *and* `all.together` *flags are logically consistent with the number of item types.*

Description

Check that the `run.overall` and `all.together` flags are logically consistent with the number of item types.

Usage

```
run_flags_validate(run.overall, all.together, item.attributes, silently)
```

Arguments

`run.overall`	If a final quality analysis should be run on the overall sample
`all.together`	If the reduction analysis should be run on all of the items agnostic of item type
`item.attributes`	A named list of attributes and item types.
`silently`	whether the print statements should appear

Value

a named list with the updated `all.together` and `run.overall` flags

`run_item_reduction_pipeline` *Run reduction pipeline for all item types*

Description

Run reduction pipeline for all item types

Usage

```
run_item_reduction_pipeline(
  embedding_matrix,
  items,
  EGA.model = NULL,
  EGA.algorithm = "walktrap",
  EGA.uni.method = "louvain",
  corr = "auto",
  ncores = NULL,
  boot.iter = 500,
  uva.cut.off = 0.2,
  keep.org,
  silently,
  plot
)
```

Arguments

`embedding_matrix`	Full embedding matrix (columns = all items)
`items`	Data frame of all items (must include ID, statement, attribute, type)
`EGA.model`	NULL, "glasso", or "TMFG"
`EGA.algorithm`	EGA algorithm
`EGA.uni.method`	EGA uni.method
`corr`	Character. Correlation method. Default "auto" uses EGAnet's automatic detection.
`ncores`	Numeric. Number of cores for parallel processing.
`boot.iter`	Numeric. Number of bootstrap iterations. Default 500.
`uva.cut.off`	Numeric in `[0, 1)`. wTO threshold for `EGAnet::UVA`. Default `0.20`.
`keep.org`	Logical. Whether to include original items and embeddings
`silently`	Logical. Whether to print progress statements
`plot`	Logical. Whether to plot the network plots at the end

Value

A named list of pipeline results, one per item type

`run_pipeline_for_item_type` *Run full pipeline for a single item type*

Description

Run full pipeline for a single item type

Usage

```
run_pipeline_for_item_type(
  embedding_matrix,
  items,
  type_name,
  model = NULL,
  algorithm = "walktrap",
  uni.method = "louvain",
  corr = "auto",
  ncores = NULL,
  boot.iter = 500,
  uva.cut.off = 0.2,
  keep.org = FALSE,
  silently,
  plot
)
```

Arguments

`embedding_matrix`	Numeric matrix (columns = items for one type)
`items`	Data frame of items for this type (must include ID, statement, attribute)
`type_name`	Character. Type label used for tracking/logging.
`model`	NULL, "glasso", or "TMFG"
`algorithm`	EGA algorithm
`uni.method`	EGA uni.method
`corr`	Character. Correlation method. Default "auto" uses EGAnet's automatic detection.
`ncores`	Numeric. Number of cores for parallel processing. Default NULL uses EGAnet default.
`boot.iter`	Numeric. Number of bootstrap iterations. Default 500.
`uva.cut.off`	Numeric in `[0, 1)`. wTO threshold for `EGAnet::UVA`. Default `0.20`.
`keep.org`	Logical. Whether to include original items and embeddings
`silently`	Logical. Whether to print progress statements
`plot`	Logical. Whether to plot the network plots at the end

Value

A named list containing pipeline results for this type, including a `filtering_audit` table with one row per removed item and a `reduction_summary` table describing NMI and item-count changes by stage.

`select_optimal_embedding` *Select Optimal Embedding and EGA Model Based on NMI*

Description

Select Optimal Embedding and EGA Model Based on NMI

Usage

```
select_optimal_embedding(
  embedding_matrix,
  sparse_matrix,
  true_communities,
  model = NULL,
  algorithm = "walktrap",
  uni.method = "louvain",
  corr = "auto"
)
```

Arguments

`embedding_matrix`	A numeric matrix (columns = items). The full (dense) representation.
`sparse_matrix`	A numeric matrix (columns = items) giving the sparse representation, aligned to `embedding_matrix` (same items and column order). This is computed once on the pre-UVA pool and then subset to the post-UVA items in the AI-GENIE pipeline; passing it in (rather than recomputing inside) preserves the pre-UVA quantile thresholds.
`true_communities`	A named list of known communities.
`model`	Character. One of "glasso", "TMFG", or NULL (to test both).
`algorithm`	Community detection algorithm (e.g., "walktrap").
`uni.method`	Unidimensionality method (e.g., "louvain").
`corr`	Character. Correlation method. Default "auto" uses EGAnet's automatic detection.

Details

Full embeddings are evaluated before sparse embeddings. Therefore, exact within-model NMI ties retain the full representation. When `model = NULL`, exact cross-model NMI ties prefer TMFG.

Value

A list with best embedding, model, communities, NMI, and comparison log.

`set_huggingface_token` *Set Hugging Face Token*

Description

Configure your HuggingFace API token for accessing gated models like Google's EmbeddingGemma or other restricted models.

Usage

```
set_huggingface_token(token, save = TRUE)
```

Arguments

`token`	Character. Your HuggingFace API token from https://huggingface.co/settings/tokens.
`save`	Logical. If `TRUE` (default), saves the token to the HuggingFace cache for future sessions. If `FALSE`, sets it only for the current R session.

Details

Some embedding models on HuggingFace require authentication:

- `google/embeddinggemma-300m`
- Other gated models

Before using these models, you must:

1. Create an account at https://huggingface.co
2. Accept the model's license on its model page
3. Generate an access token at https://huggingface.co/settings/tokens
4. Call this function with your token

Value

Invisible `TRUE` on success.

Examples

```
## Not run:
# Set token (saved permanently for future sessions)
set_huggingface_token("hf_xxxxxxxxxxxxxxxx")

# Set token for this session only (not saved)
set_huggingface_token("hf_xxxxxxxxxxxxxxxx", save = FALSE)

# Now you can use gated HuggingFace models
results <- GENIE(
  items = my_items,
  embedding.model = "BAAI/bge-large-en-v1.5",
  hf.token = "hf_xxxxxxxxxxxxxxxx"
)

## End(Not run)
```

`sparsify_embeddings` *Sparsify Embedding Matrix*

Description

Applies sparsification to an embedding matrix by zeroing out values between specified quantiles. Includes fallback strategies if initial sparsification results in all zeros.

Usage

```
sparsify_embeddings(
  embedding_matrix,
  lower_quantile = 0.025,
  upper_quantile = 0.975,
  fallback_lower = 0.1,
  fallback_upper = 0.9
)
```

Arguments

`embedding_matrix`	Numeric matrix with items as columns, dimensions as rows
`lower_quantile`	Lower quantile threshold (default 0.025)
`upper_quantile`	Upper quantile threshold (default 0.975)
`fallback_lower`	Fallback lower quantile if first attempt fails (default 0.10)
`fallback_upper`	Fallback upper quantile if first attempt fails (default 0.90)

Details

Sparsification process:

1. Zero out values between lower and upper quantiles
2. If result is all zeros, try fallback quantiles
3. If still all zeros, return original matrix

`silently` is always `TRUE`. It is only set to `FALSE` for developement and diagnostic purposes.

Value

Sparsified embedding matrix with same dimensions as input

`target.N_validate` *Validate and Expand* `target.N` *for Each Item Attribute*

Description

Ensures that `target.N` is either:

- NULL -> defaults to 60 per attribute
- A single integer -> repeated for each attribute
- A list/vector of integers -> must match number of attributes

Usage

```
target.N_validate(
  target.N,
  items.attributes,
  items.only,
  embeddings.only,
  silently
)
```

Arguments

`target.N`	An integer, list/vector of integers, or NULL.
`items.attributes`	A cleaned list returned from `validate_items.attributes()`.
`items.only`	A flag used to determine if only items need to be generated
`embeddings.only`	A flag used to determine if only embeddings need to be generated
`silently`	A flag used to determine if warnings should be printed

Value

A list of integers, one per attribute (named).

temperature_validate *Validate* temperature *for Text Generation*

Description

Ensures temperature is a numeric value between 0 and 2

Usage

```
temperature_validate(temperature)
```

Arguments

temperature	A numeric value

top.p_validate *Validate* top.p *for Text Generation*

Description

Ensures top.p is a numeric value between 0 and 1, or NULL.

Usage

```
top.p_validate(top.p)
```

Arguments

top.p	A numeric value

uva.cut.off_validate *Validate* uva.cut.off

Description

Ensures uva.cut.off is a single numeric value in [0, 1).

Usage

```
uva.cut.off_validate(uva.cut.off)
```

Arguments

uva.cut.off	A numeric value.

validate_booleans *Validate Boolean Arguments*

Description

Validates that all arguments passed to the function are scalar boolean values (TRUE or FALSE). If any argument is not a boolean, an error is thrown that identifies the offending variable by name and instructs the user to set it to either TRUE or FALSE.

Usage

```
validate_booleans(...)
```

Arguments

...	One or more variables to check. We are expecting each to be a logical scalar (TRUE or FALSE). In AIGENIE, these variables would be items.only, adaptive, plot, keep.org, silently, and embeddings.only.

validate_ega_params *Validate EGA Parameters*

Description

Validates and normalizes the EGA algorithm, unidimensionality method, and model parameters. Trims whitespace and performs case-insensitive matching. Returns canonical-cased values.

Usage

```
validate_ega_params(EGA.algorithm, EGA.uni.method, EGA_model)
```

Arguments

EGA.algorithm	A string: one of "leiden", "louvain", "walktrap" (or NULL, in which case default behavior takes over)
EGA.uni.method	A string: one of "expand", "LE", "louvain"
EGA_model	A string or NULL: one of "glasso", "TMFG"

Value

A named list with cleaned and correctly-cased values.

validate_local_embedding_model *Validate Local Embedding Model*

Description

Validates that the embedding model is appropriate for local raw embeddings. Checks for BERT-family models that provide raw feature extraction.

Usage

```
validate_local_embedding_model(embedding.model, silently = FALSE)
```

Arguments

embedding.model	Character string specifying model identifier or path
silently	Logical. Suppress informational messages

Value

The validated model identifier or path

validate_local_embedding_params *Validate Local Embedding Parameters*

Description

Validates parameters specific to local embedding generation

Usage

```
validate_local_embedding_params(
  device,
  batch.size,
  pooling.strategy,
  max.length
)
```

Arguments

device	Device for computation ("auto", "cpu", "cuda", "mps")
batch.size	Number of items to process simultaneously
pooling.strategy	Strategy for pooling token embeddings
max.length	Maximum sequence length for tokenization

Value

A list of validated parameters

`validate_local_llm_params` *Validate Local LLM Generation Parameters*

Description

Validates parameters specific to local LLM generation

Usage

```
validate_local_llm_params(n.ctx, n.gpu.layers, max.tokens)
```

Arguments

`n.ctx`	Context window size
`n.gpu.layers`	Number of layers to offload to GPU
`max.tokens`	Maximum tokens for generation

Value

A list of validated parameters

`validate_model.path` *Validate Local Model Path*

Description

Validate Local Model Path

Usage

```
validate_model.path(model.path, silently = FALSE)
```

Arguments

`model.path`	Path to local GGUF model file
`silently`	Logical. Suppress warnings

Value

The expanded, validated path

validate_prompt.notes *Validate and Normalize* prompt.notes

Description

Accepts a string, NULL, or a named list of strings/NULLs. Ensures one entry per attribute in items.attributes, returning a fully named and cleaned list.

Usage

```
validate_prompt.notes(prompt.notes, items.attributes)
```

Arguments

prompt.notes	A single string, NULL, or named list of strings/NULLs.
items.attributes	A cleaned list from validate_items.attributes().

Value

A named list of strings, one per attribute, with NULLs replaced by "".

validate_reps *Check that reps is an integer*

Description

Check that reps is an integer

Usage

```
validate_reps(reps)
```

Arguments

reps	The number of repetitions per prompt requested

Value

if valid, the reps value as an integer object type

validate_strings *Validate That Inputs Are Strings*

Description

Ensures that each argument is a single, non-NA string. Throws an error if any argument is not a character scalar.

Usage

```
validate_strings(...)
```

Arguments

...	One or more variables to validate.

validate_system.role_prompts *Checks* system.role *and* prompts *for the* chat *function*

Description

Checks system.role and prompts for the chat function

Usage

```
validate_system.role_prompts(system.role, prompts)
```

Arguments

system.role	The persona for the model. Either a string, NULL (default), or a list of strings
prompts	The prompts to be given to the model. Either a string or a list of strings

Value

if valid, a list with the system.role and prompts objects

validate_user_input_AIGENIE *Validate All User Inputs for AI-GENIE*

Description

This function performs comprehensive validation and normalization of all user-supplied inputs to the AI-GENIE package. It checks logical flags, strings, model names, item attribute structures, and ensures consistency across all interdependent components.

Usage

```
validate_user_input_AIGENIE(
  item.attributes,
  openai.API,
  hf.token,
  main.prompts,
  groq.API,
  anthropic.API,
  jina.API,
  model,
  temperature,
  top.p,
  embedding.model,
  target.N,
  domain,
  scale.title,
  item.examples,
  audience,
  item.type.definitions,
  response.options,
  prompt.notes,
  system.role,
  EGA.model,
  EGA.algorithm,
  EGA.uni.method,
  keep.org,
  items.only,
  embeddings.only,
  adaptive,
  run.overall,
  all.together,
  plot,
  silently
)
```

Arguments

item.attributes	A named list of attributes and item types. Must be validated via item.attributes_validate().
openai.API	A string. OpenAI API key.
hf.token	A string. HuggingFace API key.
main.prompts	A named list of custom prompts that the user specifies (if desired)
groq.API	A string or NULL. Groq API key.
anthropic.API	Character. Anthropic API key. Can be NULL when Anthropic models are not used.
jina.API	Character. Jina AI API key. Can be NULL when Jina embeddings are not used.
model	A string. The user-specified language model. Will be resolved to a canonical model name using normalize_model_name().
temperature	A numeric value between 0 and 2.
top.p	A numeric value between 0 and 1.
embedding.model	A string or NULL. Must be one of the accepted OpenAI embedding models.
target.N	Either a scalar integer, NULL, or a named list/vector of integers corresponding to each attribute. Used for synthetic item generation.
domain	A string describing the domain of the assessment.
scale.title	A string naming the scale.
item.examples	A data frame containing type, attribute, and statement columns. All values must be strings. Optional.
audience	A string or NULL. The intended audience of the assessment.
item.type.definitions	A named list mapping item types to their descriptions. Optional.
response.options	An atomic vector of strings listing the response options users will have. Optional.
prompt.notes	A named list or string that gives the LLM additional instructions to be appended to the prompt. Optional.
system.role	A string or NULL. Used to customize the system prompt.
EGA.model	A string or NULL. One of "BGGM", "glasso", or "TMFG".
EGA.algorithm	A string. One of "leiden", "louvain", or "walktrap".
EGA.uni.method	A string. One of "expand", "LE", or "louvain".
keep.org	A boolean. If TRUE, preserve original inputs in the output.
items.only	A boolean. Whether to generate only items.
embeddings.only	A boolean. Whether to run in embedding-only mode.
adaptive	A boolean. Whether adaptive design logic should be applied.
run.overall	Logical. Whether to fit an additional pooled EGA to items retained after item-type-level reduction.

`all.together`	Logical. Whether to run the reduction pipeline on all item types together rather than separately.
`plot`	A boolean. Whether to display plots for visual diagnostics.
`silently`	A boolean. If TRUE, suppresses warning messages.

Details

If any input is invalid or misaligned with the package's expected structure, informative errors or warnings are raised. Cleaned and normalized objects are returned for use downstream.

Value

A named list containing:

target.N A named list of integers, aligned with `item.attributes`

EGA.model Canonical model string or NULL

EGA.uni.method Canonical unidimensionality method

EGA.algorithm Canonical community detection algorithm

model Resolved model string for text generation

item.type.definitions Cleaned item type definitions (if provided)

item.examples Cleaned item examples (if provided)

item.attributes Cleaned and normalized item attributes

prompt.notes Cleaned and normalized prompt notes (if provided)

main.prompts Cleaned and normalized main prompts (if provided)

custom A flag signaling whether we are in custom mode or not

`validate_user_input_GENIE`

Validate All User Inputs for GENIE

Description

Validate All User Inputs for GENIE

Usage

```
validate_user_input_GENIE(
  items,
  embedding.matrix,
  openai.API,
  hf.token,
  jina.API,
  embedding.model,
  EGA.model,
```

```
  EGA.algorithm,
  EGA.uni.method,
  embeddings.only,
  run.overall,
  all.together,
  plot,
  silently
)
```

Arguments

items	A data frame with columns: statement, attribute, type, ID
embedding.matrix	Optional numeric matrix/data frame with items as columns
openai.API	OpenAI API key (string or NULL)
hf.token	HuggingFace token (string or NULL)
jina.API	Jina API key (string or NULL)
embedding.model	Embedding model identifier (string)
EGA.model	EGA network model (string or NULL)
EGA.algorithm	EGA algorithm (string)
EGA.uni.method	EGA unidimensionality method (string)
embeddings.only	Whether to stop after embeddings (boolean)
run.overall	Logical. Whether to fit an additional pooled EGA to items retained after item-type-level reduction.
all.together	Logical. Whether to run the reduction pipeline on all item types together rather than separately.
plot	Whether to show plots (boolean)
silently	Whether to suppress messages (boolean)

Value

A named list containing all validated and normalized parameters

---

validate_user_input_local_AIGENIE

Validate All User Inputs for Local AI-GENIE

Description

Comprehensive validation of all inputs for local model execution. Reuses existing validators where applicable and adds local-specific validations.

Usage

```
validate_user_input_local_AIGENIE(
  item.attributes,
  model.path,
  embedding.model,
  main.prompts,
  temperature,
  top.p,
  target.N,
  domain,
  scale.title,
  item.examples,
  audience,
  item.type.definitions,
  response.options,
  prompt.notes,
  system.role,
  EGA.model,
  EGA.algorithm,
  EGA.uni.method,
  n.ctx,
  n.gpu.layers,
  max.tokens,
  device,
  batch.size,
  pooling.strategy,
  max.length,
  keep.org,
  items.only,
  embeddings.only,
  adaptive,
  run.overall,
  all.together,
  plot,
  silently
)
```

Arguments

item.attributes	Named list of attributes (same as API version)
model.path	Path to local GGUF model
embedding.model	Local embedding model identifier
main.prompts	Optional custom prompts
temperature	LLM temperature
top.p	LLM top-p sampling

target.N	Target number of items
domain	Assessment domain
scale.title	Scale name
item.examples	Example items
audience	Target audience
item.type.definitions	Type definitions
response.options	Response scale options
prompt.notes	Additional prompt instructions
system.role	System prompt
EGA.model	EGA model type
EGA.algorithm	EGA algorithm
EGA.uni.method	EGA unidimensionality method
n.ctx	Context window size
n.gpu.layers	GPU layers
max.tokens	Maximum generation tokens
device	Embedding computation device
batch.size	Embedding batch size
pooling.strategy	Embedding pooling strategy
max.length	Embedding max sequence length
keep.org	Keep original data
items.only	Generate items only
embeddings.only	Generate embeddings only
adaptive	Use adaptive generation
run.overall	Logical. Whether to fit an additional pooled EGA to items retained after item-type-level reduction.
all.together	Logical. Whether to run the reduction pipeline on all item types together rather than separately.
plot	Show plots
silently	Suppress messages

Value

A list of all validated parameters

`validate_user_input_local_GENIE` *Validate All User Inputs for Local GENIE*

Description

Validate All User Inputs for Local GENIE

Usage

```
validate_user_input_local_GENIE(
  items,
  embedding.matrix,
  embedding.model,
  device,
  batch.size,
  pooling.strategy,
  max.length,
  EGA.model,
  EGA.algorithm,
  EGA.uni.method,
  embeddings.only,
  run.overall,
  all.together,
  plot,
  silently
)
```

Arguments

`items`	Data frame with columns: statement, attribute, type, ID
`embedding.matrix`	Optional numeric matrix of pre-computed item embeddings, with embedding dimensions in rows and items in columns.
`embedding.model`	Local embedding model identifier or path
`device`	Device for embeddings ("auto", "cpu", "cuda", "mps")
`batch.size`	Batch size for embedding generation
`pooling.strategy`	Pooling strategy ("mean", "cls", "max")
`max.length`	Maximum sequence length for embeddings
`EGA.model`	EGA network model ("glasso", "TMFG", or NULL)
`EGA.algorithm`	EGA algorithm ("walktrap", "leiden", "louvain")
`EGA.uni.method`	EGA unidimensionality method ("louvain", "expand", "LE")

`embeddings.only`
: Whether to stop after embeddings

`run.overall`
: Logical. Whether to fit an additional pooled EGA to items retained after item-type-level reduction.

`all.together`
: Logical. Whether to run the reduction pipeline on all item types together rather than separately.

`plot`
: Whether to show plots

`silently`
: Whether to suppress messages

Value

A list of all validated parameters ready for local GENIE execution

Index
